Technically, Atari being a name, it should read Atari with a capital
letter, however the Atari logo is always spelled with 5 capital letters,
so actually I would say:

Atari - when used normally in a sentence.
ATARI - when used in proximity of the Mount Fuji logo (ie:"/|\ATARI").

Next question ? ;-)

The codes are orthogonal, so it's 27 (ESC) followed by 128+
1 Bold
2 light
4 italic
8 (can't remember)
16 superscript
32 subscript
in any combination.

>All attributes have to end with 27 128, except 'normal' text which
>doesn't use an escape sequence. And normal spaces (32) have to be
>replaced with ASCII 30.
>
ISTR 32 is used for 'hard' spaces which are not recognised as word
breaks. I have a program (in Modula 2!) around somewhere which uses
attributes e.g. author, title etcetera coded up as combinations of these
to create a simple HTML form of the document and generate an index with
HTML links- most of WordPlus format is in there somewhere. One of these
days, I'll rewrite it in C, but it works as it is, so...

I just installed AHDI5, with the Xcontrol-panel, it works fine, but now the other prg's i have in the auto-folder don't work anymore. I hear people talk about that some programs should be loaded before another, is this the problem here? And if so, how can i create an order in which the programs are being loaded??

Good question, but too late. When developing the JPEG saving module
for GEMView 5 years ago, I planned to build a GEM interface for
lossless optimizations (which does jpegtran today), comment handling,
and other JPEG manipulation features.

However, at this time there was no interest by Atari people for
reasonable JPEG handling, so I abandoned the project. You will
confirm that even today JPEG support by typical Atari programs
is behind the standard (consider which Atari programs can handle
progressive JPEG), so there is no motivation to spend much effort
in special tools, sorry. The time is better spent (with noticeable
resonance) by contributing new features to the general (platform-
independent) development, that's my conclusion.

Regards,
Guido

> this program does?

Some/most/all TOS versions have problems with memory after opening 40 folders, this program allows you to change the number of folders your machine can open before you suffer from the problem, if you change the name you can change the number of folders it will allocate memory for. Basically just leave it inplace and allocate memory for say double the number of folders you expect to ever open before you restart your machine. Guy Harrison gave a very detailed explanation about the problem recently if you are interested, try searching www.dejanews.com

17. Re: IDE CDROM/extHD for falcon, how?

The main problem is to find a driver for ide cd-roms.
CD-TOOLs are OK, but they are in german. wb-systemtechnik ?

Next point: ide cable, not longer as a maximum of 40cm!
(Sorry, i can't translate cm to inches in the moment)

Whitch device do you have? Take not more as 100mA from the +12 part
of the internal Falcon psu..
+5V are OK, enough avaiable.

Err, I think you are missing the idea of it all,

Wordplus or atleast first word plus can save in html format, just do save
as and then change the extension to htm, then it will save in a format
that CAB can read.

If you want to save the styles and images aswell you will have to learn
HTML, althoough it would not be too dificult to do.
```

If all this sounds daunting, i'll be happy to do it for you for something

I'm not so sure of that Jo.
I never use Wdialog but when I run CAB 2.5 on a ET6000 card in true
color mode the colors are incorrect. I've this also on my TT
using a Crazy Dots II card running in true color mode.
Neil has mentioned this I can only confirm his findings. The colors
looks right with or without *wdialog" when using 256 color mode.

I'm afraid that I know very little about HDdriver, but I suspect that it is
not your problem.

You must consider termination with multiple drives. Is your first drive
terminated (resistor packs or switches?) Is your last drive terminated (I
recommend a pass-through terminator -- costs about $10). Are all other drives
NOT terminated?

You must consider cables. Are you using good condition (preferably short)
cables? A cable that has been mistreated (twisted, etc.) may look fine, but
often will not work. I treat my cables like china, having gone through "bad
cable hell".

If neither of these are your trouble, I'd recommend changing software.
Extendos Pro works beautifully for me, and I happen to know it supports the
Apple 300 (though I've never actually tried that drive myself).

Yikes!!! If this is true, I'd recommend contacting ASH.

As for 00/00/28, that is what TOS defaults to if the clock is not set. It is
not a big concern till 12/31/2027.

Sheldon, there is an internal IDE interface available for 1040STe users
now...you can also add HD floppies, newer versions of TOS, and the serial
port upgrade... Cool, eh? ;-)

This may sound daft, but couldn't it be true? There were rumours a
couple of months ago that a similar suit had prevented the launch of the
analogue joypad with shock feedback for the Playstation in the UK. The
dual shock version is due soon, but isn't it at all possible, given
Microsoft's feedback joystick?

D'oh! I had forgotten that it comes with Kobold, which I do own. The installation program would't give it to me, because I was using MagiC. However, (at least) MenuInfo needs it, even with MagiC.

I now have it, though. Thanks.

Sounds like a typo to me.

Elite 3 was/is Frontier: First Encounters.

IIRC it was only released on the PC and was withdrawn by Gametek shortly after it was released and they no longer support it, the main reason being that there were so many bugs in the game which make it very difficult to play.

That's true. Opera is in fact a nice browser which is worth buying.
For example, Opera takes only a second to run, while bloody Internet
Explorer or Navigator completely mess up my PC, when being started.
This was the main reason, I decided upon to buy a browser. Ok, IE and
Navigator are for free, but have a look on your HDD space left after
installation of both of them :(((
Opera is cool with only 2 MB of HDD space :)))

WDIALOG used to have some very bad bugs. Just recently this was discussed
with the Behnes, and fixed. I do not know if the fixed version has seen
the light of the public, though.

Think about it. IF XControl causes a "Falscher AES Funktionsaufruf", this
means it calls a non-existing AES function. This is with WDIALOG. Without,
the error does not happen. So this particular AES function exists if WDIALOG
is *not* loaded, but not anymore, once you loaded WDIALOG. Can't be a bug in
XControl, can it ?

Cheers Peter

PS.: I haven't seen much of the internals, but from it's external behaviour
I'd say it's probably the best (i.e. bug-free) piece of software that
Atari ever released. The only quirk I know of is that it always loads
it's CONTROL.INF from drive C, even if you accessory-booted it from A.

It was just an analogy (maybe a bad one) that I hoped would help get my point
across. The point is that it's useless to start curing problems of the world
by starting at the wrong end. Concerning people using bad languages, look for
the place where they really learn it from, disapproving it on Usenet where
it's rare anyway doesn't help as the kids do not learn it from Usenet.

Concerning my head, I'm glad you added that big smile.

It was a bit of news that went around the whole world, and was a big subject for several days even here. I reckon it did not just move me so deeply, and since everybody should have heard of it, I figured everybody should have reflected on the issue, so I thought it might work as an analogy. Apparently it didn't at least for Tony. Anyway, this is off-topic ;-)

> This has happened throughout time. It's a phenomenon caused by psychopathic
> cowards. Unfortunately, they got access to some hunting rifles. In a country

Unfortunately it's not only that. You're right that it's about cowardice, but that's only half of the truth. What kind of pervert teaches his six or seven year old son to shoot with guns, regardless if air-driven, hunting rifle, or pumpgun or Kalaschnikow ? Regardless what target. The child does not need to be a coward to misunderstand that, especially if some majority of movies tells it that it's a hero when it uses the guns for violence.

for sale or trade (see below...)

Sampling CD set:

Mind Control- 3 CD set geared towards industrial / electronic music
- all disks in mint cond. with manual
- each disk in separate jewel case instead of cheesey
packaging that it came with..

I'll also include the Noise Loops Sampling CD with this set.

$100.00 for all 4 disks. Ship/hand is $4.00, mailed first class
priority. (additional charges for canada/overseas orders..) Money
Orders and Checks only! (payment by check will take an additional week
in order to 'clear.')

addendum: will also trade for a 1/4" patchbay (at least 12 'ports').
preferably with patch cables (at least 4 or so...) included. must be in

excellent/very good condition WITH manual.

thanks again,

chrisTiaN

THE COMPUTER DUNGEON carries many Atari items in stock for the ST,
Falcon, Lynx, Jaguar, and Classic (2600-5200-7800) systems.

*New & Used Software for the ST-Falcon
*New & Used Accessories for the ST-Falcon
*New & Used Hardware items
*Full Registered versions of GREAT Shareware gaming titles
*New & Used Atari Video Game cartridges, systems, & accessories
*ST Plus Fanzine and Atari Computing Magazines
*PD/Shareware disks that YOU create
*New Atari 8bit gaming cartridges (Super Pac-Man, Pac-Man Jr., more)
*Many more new & used items arriving on a regular basis.

For a look at our products and services, visit our website at:
http://www.mcs.net/~isis/dungeon/dungeon.htm
or call us at 708-547-7085

We accept VISA & MasterCard. ST Plus Fanzine is included FREE with
every order.

Thanks for taking the time to read this and we look forward to helping you with
all your Atari needs.

Klaus,

re: Atari ST Book

> Sure - i have one and it still works great. But it's not for sale.
> (anyone any idea how much it's worth?)

Probably the amount you'd be willing to sell it for. At least that's the amount it would be worth to you. ;-)

The ST Book was a neat design. Its just too bad Atari didn't base it on the 68030 processor and go into full production with the ST Book. We could have sold a boo-koodle of them!

Are you sure that's not the internal IDE hard drive from an Atari
Falcon030? Does the drive have an IDE or SCSI interface? I can't imagine
someone trying to put an internal hard drive inside an Atari 520 or 1040ST
system --- there simply isn't any place to put it along with the necessary
interface.

Sheldon (Computer STudio - Asheville, NC)

> limitations and inability to represent photo images properly.

Quite so. I would've been more concerned about removing GIF->JPEG
capability if it were a critical feature ... but in general it's
a bad idea. When cjpeg was first developed, enough people had
photos stored in GIF format that it made sense to provide that
conversion capability, and even to add frammishes like the -smooth
option to try to improve the quality of the results. Today, though,
I don't think there's much need for GIF->JPEG conversion. Given
Unisys' legal threats, the decision was pretty much a no-brainer.

Charles, Opera can use Javascrip - not Java. According to the docs with the latest version (3.20), java compatability is scheduled for version 4.0 which is suppose to be out sometime in the 2nd/3rd quarter of this year.

>Ultra DMA IDE drives also work.

The drives that are being advertised extensively, in the US, at the present time are IDE. An example is a Seagate 6.4GB Ultra DMA/33 HD for $229 (US). These are 3.5" bare drives - so the only way they would be useable for an Atari is in an external case with an IDE interface (I guess if one had a Falcon in a tower you could use it there). What confuses people is the "DMA" :).

So these drives simply support the ATAPI specification I guess. ATAPI drives support most SCSI commands but are connected to the IDE port Of course there are some limitations because IDE has no bus structure like SCSI has. But basically the command set is identical and ATAPI devices are not recognized by drives not knowing about ATAPI.
Because ATAPI is in a lot of respects similar to SCSI the new HDDRIVER 7.5 is going to support these devices with its integrated SCSI driver interface. This way you can connect ATAPI devices, e. g. CD ROM drives, to your Falcon, Hades or Milan and use drivers like SPIN! or software like MUCKE oder CDPLAYER with them.

I don't think the full version will change anything. But as you're
experiencing some unique problems it's quite likely that there is some
kind of hardware problem.
Note that HDDRIVER will only offer partitions that have correct
parameters and that these parameters must be compatible with your
version of GEMDOS. A partition larger than 256 MByte won't be available
on old versions of TOS, for example, because TOS 1.0 doesn't support
partitions of this size. See the online help in the partitioning dialog
box of HDDRUTIL for more information about partition sizes.

Funny, I was going through some of my old ST Magazines from 1995 (those were the days...) and I saw an ad from Centek: "The new Centurbo 2, available this summer".

They claim thay are still developing it, and prototypes have been presented at the last Atari shows, but they seem to have some problems getting it finished (for 2 years!). As far as I'm concerned, I won't buy anything from them until they start selling the stuff they announce.

Well, maybe. I'll do some experimenting here and let you know. I usually use preformatted floppies, so there's no problem.

Best is to say, as a rule that "some" TOS versions do not format correctly, so it's better to format the disks on a PC, or use a 3rd party formatter.

Hi George!

What is version is your AHDI?
Try upgrading to a newer version or another driver!

I had similar problems with various programs before I changed from AHDI to HDDriver... I suggest you do the same. HDDriver is a _lot_ faster, more compatible, easier to use and doesn't have those nice "features" you described.. :)

Another good driver is CBHD, I think it's free, it is faster than AHDI...

Good luck!

Hi, Hallvard!

The word I received from Chris Krowchuk via email
was that he was branching out to other platforms,
but Atari products are still available. He recommends
http://www.compdirect.com/atari.html (maybe .htm).

Since he's still updating his pages, there may be other
changes afoot, as well.

OK, after looking at the RSC, I saw the icons you're talking about. To be honest, I know very little about what wdialog is supposed to do. Having just installed 1.98 a few days ago, all I can see is its extended print menu in CAB. Is there any other benefit in running it? I can't see any difference under Geneva. The archive, downloaded from GEnie, didn't have any docs. Judging by the extra printer drivers listed, wdialog seems to assume the latest NVDI is present (which isn't the case for me).

TOS is the entire Operating System, GEM is part of TOS and is the Graphic
Evironment Manager. There are also AES and VDI which other parts of the
OS. GEMDOS is in charge of the filesystem.

To see which version you have, you need a utility such as sysinfo, but
basically, if you have never modified anything, you can base yourself on
this:

ST,STF,STFM 1.0 or 1.4
Mega ST 1.2 or 1.4
STE 1.6 or 1.62
Mega STE 2.05 or 2.06
TT 3.xx
Falcon 4.01 or 4.04

CPX files are Control Panel Extensions.

When Atari first introduced the STs, you could use ACCs as desktop
accessories, but these were limited to 6 at one time.

When TOS 2.06 was released, Atari included Xcontrol.acc (and a bunch of
CPX modules that replace the old control.acc) which is a modular system
that allows you to load CPX files, and unload them, and change them,
without rebooting. Xcontrol runs also on all the older TOS versions too,
but requires more memory than the original control.acc.

You can find Xcontrol on most FTP sites, and in the Quick FAQ.

It's a bug fix for the famous 40 (or was it 50?) folder bug.

If I recall, there was a problem if you had more than more 40 (or 50) folders on a disk. I think it was due to memory allocation or something and caused errors in some programs.

foldr100.prg allocates more memory, so you can have 100 folders. If that's not enough, you can increase the amount by renaming the program to foldr200.prg or foldr400.prg.

BTW, it should be in the Auto folder of your boot drive, not in the root directory.

I forgot to add: for the earlier machines, you can see if you have 1.4 or
not by opening the Desktop/Information dialog box with a colour monitor
or TV. If the Atari logo has some nice rainbow scrolling colours, then
it's TOS 1.4 (also called "rainbow TOS").

I just found this on Hasbro's web site...

Food for thought, isn't it?

Nick

---<FILE ATTACHMENT>----------

HASBRO INTERACTIVE SUES MICROSOFT FOR ILLEGAL USE OF
FORCE FEEDBACK PRO TECHNOLOGY.

BEVERLY, Mass., April 1, 1998 - Hasbro Interactive,
Inc. today announced that it has filed a lawsuit in
U.S. District Court against Microsoft Corporation for
illegal use of a technology patented in 1978 by Atari
Corporation and recently acquired by Hasbro
Interactive.

The technology developed by Atari, called Super-
Buzz(tm), was never commercially implemented at the
time, but implemented action feedback from game systems
to the player, by a patented vibro-buzzer hidden in the
joysticks base. This buzzer could be set off by the VCS
games console.

Hasbro Interactive is seeking an injunction to prevent
Microsoft from improperly using the Super-Buzz(tm)
technology. Hasbro Interactive is also seeking to
prevent Microsoft from misleading Force Feedback
developers and to prevent them from delivering anything
but fully Atari compatible Super-Buzz(tm) technology
implementations.

Specifically, the complaint charges Microsoft with
patent infringement, false advertising, breach of
contract, interference with prospective economic
advantage and unfair competition.

"Hasbro Interactive's first responsibility as stewards
of the Super-Buzz(tm) technology is to preserve the
significant investments that Atari Corporation, and
therefore Hasbro Interactive, have made. We are
required to take this action on behalf of the entire
joystick industry, the Atari heritage and Hasbro
Interactive's shareholders," said John Bersaetz,
president of Hasbro Interactive's lawsuits division.

Bersaetz added that for the past two weeks and up until 6 p.m. Sunday, March 29, Hasbro Interactive worked diligently with Microsoft in hopes of convincing them to abide by their agreements.

According to the complaint, "Rather than comply with its contractual obligations, defendant Microsoft has instead embarked on a deliberate course of conduct in an attempt to fragment the standardized application programming environment established by the Super-Buzz(tm) technology, to implement the Force Feedback technology in a manner calculated to cause software developers to create programs that will operate only on platforms that use defendant Microsoft's Win32-based operating systems and no other systems platform or games."

"We examined all of our alternatives and felt that we had no choice but to pursue litigation," said Peter Borris, Vice President and General Counsel, Hasbro Interactive, Inc.

The suit was filed today, April 1, 1998 at United States District Court, Northern District of Massachussets, Beverly Division.

The complaint specifies that Hasbro Interactive is seeking "preliminary and permanent injunction enjoining Microsoft. . .from using the Force Feedback Pro technology; from doing directly or indirectly any acts or making any statements that are likely to cause confusion, mistakes or deception in the marketplace as to the compatibility of their joysticks with Hasbro Interactive's Super-Buzz(tm) technology . . . from doing directly or indirectly any acts that are likely to diminish the value of the Super-Buzz(tm) logo. . ."

Hasbro Interactive noted that users will soon be able to access applications written for the Force Feedback Pro joystick by using the new Super-Buzz98(tm) joystick, soon to be released by Hasbro Interactive. In addition. Using this product, Hasbro Interactive deliver high-performance, fully-compliant Super-Buzz(tm) feedback for the PC Compatible game industry.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. 101. Help with STinG/HSMODEM?

Newsgroup: comp.sys.atari.st
Date: 1998-04-01 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <6fukc4$ke5@news.Hawaii.Edu>
Source record: 104090

Greetings,

I have recently installed the latest STinG package, including HSMODEM7, the new STinG modules, serial CPX, etc... On my 48mhz TT, I am getting a very low data transfer rate, about 1/6th of the speed of a Zmodem transfer of the same file.

A 100k file takes 20 seconds with Stalker/Zmodem while it takes over 120 seconds with STinG and MGftp.

I expected some performance degradation due to the networking communication, but this seems excessive. I tested a 28.8 modem, and there was no significant change in performance.

I have experimented with different buffer size settings in HSMODEM, as well as networking settings (for MSS, MTU, RWIN, etc...) - nothing seems to make much of a difference.

Does anyone have any recommendations?

I have to believe that this is all due to some configuration problem, and would greatly appreciate some help.

Thanks!

Aloha,
John Perez - jperez@hawaii.edu

Is this connecting ATAPI IDE devices to the Falcon SCSI port rather than
the internal IDE connector? If so, what kind of cable or adaptor is
required?

hallo leute,

vielleicht kann mir ja jemand helfen, ich habe folgendes problem:

ich habe einen atari 1040 stf geschenkt bekommen. mit monitor, maus und
drucker.
aber ohne jede software!
beim booten erscheint zwar die benutzeroberflaeche tos, aber weiter kann
ich leider gar nichts testen.

hat jemand von euch zufaellig noch irgendwelche software fuer den st,
die er nicht mehr braucht? ich wuerde mich ueber eure mails sehr freuen.

falls mir jemand ein angebot machen will fuer das teil, kann er mir
natuerlich auch schreiben.s/w-monitor, panasonic-24-nadler.

gruss

The word "other" is wrong. GEM basically consists of VDI and AES.

TOS consists of GEM, and a part that resembles the conventional idea of
an operating system. The latter is BIOS and XBIOS on the lower level (takes
care of hardware), and GEMDOS, which uses BIOS and XBIOS, and is responsible
for filesystems, processes, etc.

110. Falcons w/music SW/HW FS

Newsgroup: comp.sys.atari.st
Date: 1998-04-01 00:00:00 UTC
From: guitarmn@earth.execpc.com
Message-ID: <6fv0dj$731@newsops.execpc.com>
Source record: 104099

After many nights of soul-searching sleeplessness I've decided to part with two of my Falcon systems. Both work flawlessly, and I'll guarantee they do or youmay simply ship them back within three days. If you need to mix/match or are interested in the pieces I'll consider offers but the best price will go with a package sale. So, here they are:

Two Atari Falcon 030 computers, each w/14megs of ram, 80meg HD, and all necessary audio mods. One is in a Wizztromics rack (3 sp.)with a zillion ports and PC-compatible external keyboard and is further housed in a 4-space Calzone flight rack, while the other is a standard Falcon (all-in-one unit).

SMP 11 2in/4out MIDI interface w/SMPTE

FA8 Adds 8 analog outs to the Falcon

Cubase Audio Clock Allows Falcon to use 32khz, 44.1kh, 48khz audio files and hear/edit them at proper tempo/pitch

Falcon Digital Interface Adds digital ins/outs to the Falcon

Two Color monitors (15")

External CDRom (4x)

Two external 1 gig scsi hard drives

CDRom (2x) and Syquest 44 drive with one cart housed in external case

14.4 fax/modem

Micro MidiMacman Adds another midi out to the Falcon via the LAN port

Falcon Colorburst hand scanner

All cables/mice/etc. necssary to connect each of these items is available

Now the software:

Cubase Audio Falcon 2.06 16 tracks of simultaneous audio

Two copies of Logic Audio Falcon 2.01; each comes with the LOG3 interface (adds 3 more midi outputs to the Falcon)

CDs:
Crawley Crypt 1, 2
All Things Falcon
Atari Public Domain and Shareware

ICD Pro utilities 6.5.5

HDDriver7.12

Pagestream 2.2

Extendos Pro

Stalker 3

Neodesk/Geneva

Two copies of Warp 9

Publishing Partner

XBoot 3

Screenblaster 2

Atariworks

Diamond Back 3
Diamond Edge 2

Imagecopy 4

Many graphics programs, wordprocessors, etc.
Tons of disks of games/shareware/etc. These will go with one of the systems.

I want these systems to go to someone who cares about a fine tool, who understands exactly how cool these actually are, so if I can help by answering questions via email that's perfectly fine with me. Also, if you buy a system and don't understand something you are free to call me anytime and if I can help I'd love to do so. I know, tech support--wild, huh?!
All items are best offer, and I want to sell ASAP, so you'll have to ride the line between giving a fair $ amount vs. my timeframe for sale (by the end of April). Thanks in advance.

This sounds similar to the problem I am having with the
latest STiNG modules. All data is coming through in 100 byte blocks.
It's extremely slow. I don't know what changed, but I didn't have this
problem with earlier versions.

On 1 Apr 1998, John Perez wrote:

>using a Crazy Dots II card running in true color mode.
>Neil has mentioned this I can only confirm his findings. The colors
>looks right with or without *wdialog" when using 256 color mode.

Well I was only speaking about my very low configuration I have only
access to 15 bits mode, but nevertheless ... no matter I use Cab in
8bits or 15 bits color modes it always show the right icon strip ...

Whenever I run Wdialog before CAB I receive the wrong icon strip.
That's what I know for the moment Martin ... in fact nothing really
important because I don't use so much Wdialog with Cab only when it's
time to print ...
Wdialog offers much more printing options in Cab than normally ...
let's take attention at a new button in Cab print dialog when Wdialog
has been run ...
Let's look and say me more about that please ...

See you at Neuss Martin :)

Source record: 104107

Ken Macdonald <macdonald@cfcsc.dnd.ca> inquired politely:

M > Does anyone know of a program called DataManager?

DataManager ST was one of the programs from the same people who did
WordWriter, SwiftCalc, and Partner. I've forgotten the name. Whoops
- Just remembered - TimeWorks. Which may help, as TimeWorks also
wrote these things for other computers, including (shudder) DOS.
Actually, Datamanager came in two flavors - one relational, one not.

M > I need to know if I can use another program to open these
M > files, or some info on this DataManager program.

According to Ralph Turner's Atari ST books, database files tend to
come in just a few formats, and conversion between them is usually
done by loading the old file into a database that can read it, and
saving it out as a different format, loading the new file into a
different database program that can read /it/, saving, etc, etc. I
would start by trying to load a backup into Atari Works - it seems
to have some import/export flexibility.

Hello everybody!

One or two weeks ago we discussed about ATARIs and the year 2000
problem.

All ATARI (esp. MagiC users) have been so proud that their
system will have nothing to fear concerning the millenium bug.

But now - tadaaaa - there it is! Yesterday I wanted MGSEARCH, the
MagiC file search application, to look for any file created after
March 22nd. And it found many files with GEMDOS date of 00/00/28 which
is the result of a faulty creation routine in an old TOS version.

Apparently the search program recognised these files as created some
time in the year 2028.
But the main problem is the following: the search mask of MGSEARCH
does not allow an "elder than" date which is later than the parallelly
given "younger than" date. So the two digit year mask assumes only
19xx dates!
Worse, MGSEARCH only accepts year digits in the range 80..99 (which
means 1980 to 1999)!

I understand that programmers in the seventies did not bother with the
year 2000 in favour to save expensive RAM and disk space.
For MagiC 5 (which includes MGSEARCH) is developped in the very last
years of this century (and this millenium) I think it is a real
(though little) scandal!

Let's hope the best and prepare for the worst!

(The best = this bug will be fixed in the next version)
(The worst = it won't be)

Greetings to all MagiC users
Carsten

>any problem with "wasting memory."

I wasn't clear. When you set the memory in Cab there are two ways it
can be implemented (I have no idea which is). Either Cab grabs one
block of the designated size and hangs onto it, or it can grab lots of
blocks of indeterminate size until the designated total is reached.
The former "wastes" memory in that it may never get used. The latter
fragments it.

Same here. Unfortunately there is no system call to do it. It is
theoretically possible to accomplish this yourself but not in practice
without (possibly) tying up all memory for a short time.

>But I don't think that's applicable here. I don't do

It doesn't know that it isn't competing though. ;-)

>That's hardly practical.

Nope - only if you happen to regularly use a program with Cab that
won't otherwise load!

>Surfing the Web and using the graphics cache is an

Agreed. Question is, do you tie up the whole lot all the time or not?

Nope. Disable it. I arranged my hard disk so that the boot partition
was <=16Mb and the rest >=32Mb. This allows it to be plugged in and
still boot on older machines.

>Auto Folder
>hddriver
>magixboot
>BigDos

>Pinhead

Don't think this is needed or desired with MagiC, iirc the "fast load"
option does the same thing.

This is typical of the error you get when you install an icon for a
non existent partition so it would seem reasonable to assume your
cdrom driver has not initialised.

>3rd. When I boot and the computer starts to load the UIS III program the

>there and Icon editor for MagiC?

There is in Ease but iirc any resource editor will do the job. Decide on which desktop you want to use before sorting this out.

Most common cause of this is the power supply (psu) - usually dry
solder joints (sometimes the actual on/off switch) and thus may be
fixable by anyone with enough knowledge to remove the psu and use a
soldering iron on the psu tracks without electrocuting themselves.

Unfortunately by the time this problem crops up there has sometimes
been heating damage to the components themselves so don't expect the
supply to last for a vast amount of time (but it might) after it's
fixed (3 months or so is what the UK ones I fixed averaged).

>and regular
>PC dealers won't have anything to do with them.

PC power supplies can be made to fit but not within the standard case.

>Although I use an IBM
>now, I would still like to use it for the music software I have for it.
> Any leads would be greatly appreciated.

You might find it easier to replace the machine with another 1040.
Alternatively you could approach a TV repair or electronics specialist
- there isn't that much involved in removing an internal psu from an
atari (darn sight easier than my PC psu ever would be).

The "comma delimited" format is just about universal so you'd be very
unlucky if this wasn't available but without more details it's going
to be tricky for anyone to help further.

If you also have access to a PC for example then there is a two stage
process I can think of. Get the Sharware word processor Marcel off an
FTP site. This can import 1stWord files and export in RTF which you
can them import into the PC's Word - which aside from turning it into
html will also bung in loads of redundant html of course. What else
would a PC do? ;-)

>Alternatively, is
>anyone familiar with the WordPlus file format and would be willing to
>share this information so that I could write a converter?

If no-one else can help then let me know. Somewhere in my huge pile of
"unsorted" paper is the file format info. I could try and locate it
this weekend, scan it and email it to you. Shouldn't be too large -
couple of A5 sheets iirc.

ob_flags 9 and 10 select INDICATOR/BACKGROUND/ACTIVATOR status (ie the buttons).

>I know there's something called "Mydials" (and there are probably others as >well), and I think this has something to do with it, but I don't know any >more than that.

Neither do I, never used it. I would assume if it were used by a program though, that the fancier stuff would be displayed automatically when deemed appropriate. Certainly seems to be the case for the progs I used which advertise it is being used.

>I'm not a programmer (know very little about that sort of thing), but I do >mess around with RSC files using RSC editors now and then (i.e. "ORCS" or >"RSC master").
>
>So, what should I do if I want to replace the current dials in a RSC file >with the more modern round ones etc?

With MagiC you can add keyboard shortcuts to dialogs (usually not windows as the code would have to know) and implement Mac style toggle boxes for buttons and radiobuttons without affecting older Gem versions by messing with ob_flags etc. Unfortunately I have lost the docs on this so I'll have to leave it to someone else to explain.

>drive. Is this related to or compatible with the Atari ST DMA port?

Not in the slightest, DMA stands for Direct Memory Access and is a
method used by (any) hardware to avoid having the processor involved
in transfering large amounts of memory from one place to another.

Bascially, it is a very fast (E)IDE drive with a special controller
that posesses aspirations to schizophrenia. It wakes up as a standard
IDE then pretends it is a SCSI device - at least this is what it makes
Windows (NT) think. Windows 95 probably thinks it is a banana.

Thus I feel obliged to state, it will come as no surprise to me if
someones states it'll work just fine! ;-)

Definately true.

>Better use the second method and format the disk on the PC (be sure to use
>DD (720 KB) disks and not HD (1.44 MB) disks formatted as 720 KB!!!!).

Even this is not guaranteed to work in all cases. I've been finding to
my disgust that if I insert certain atari written "PC compatible"
floppies into my Windows NT PC it a) rejects them leaving me little
choice but to format on the PC - and b) you would not believe the
amount of times it then fails to format them properly itself. It
doesn't seem to care about any permutations for formatting you can
dream up with a DD atari drive and an HD PC drive, one combination is
just as likely to fail as another.

The only combo that *is* reliable for me appears to be a format on the
Atari then copy the bootsector off a floppy formatted on the PC over
the top of the atari bootsector with KnifeST.

I've a feeling it'll not be long before I write a program to do this!

It was the reason I used it - I had no gdos of any kind at the time.

>When he loads a document he gets a
>message (or some messages) that the program can not find some (bitmap)
>fonts.

You have to set the path to them. Perhaps the new version is not looking in the same place, or is looking in the same place and finding the old fonts incompatible.

>With the old program, he did not have this. What can he do
>about this?

When mine started messing around, which I admit was rare, the trouble did have a habit of persisting. I usually trashed the lot after copying the documents somewhere then re-installed it from scratch.

>I can not really help him, because I use myself Papyrus.

I can't much either but I did use a cover disk version of it for a while. iirc, you could bomb it by by specifying a layout that referenced stuff that no longer existed. Possibly this could even have been as simple as a font not loaded but the layout was trying to reference it as I think it stored path information in some of the datafiles.

But XControl has also problems, if used with WDialog. When the ACC is
installed, there is a alert 'Falscher AES Funktionsaufruf [Abbruch]',
so what CPX server is ok then or is this also a problem of WDialog?
This is with TOS 3.06 + NVDI 4.11 R3 ET4000 and WDialog 1.97

Hi Nick,

I'll second that.... SoftPC emulates a 80286, so go figure. I even doubt SoftPC
can run WIN 3.1 decently... Never tried it, actually.

bdc> Was there any documentation with the disk? Any at all?

Hi Boris,

nope, just a German readme file, as Derryck told you already. I think someone (Raymond Lohengrin?) posted a "manual" here a few weeks ago, that said the same thing.

I got the impression you're running a slightly different version of SoftPC than I'm running, looking at a 135 K compressed file. Mine was 285 K, where the Softpc.prg file is 1.2 Megs big. That was the bundle I found somewhere with no HDF files at all, also no Insignia files with it.

It looks like I was (until now...) the only one with those Insignia files around... <G> ... lucky for you!

Howdy Charles,

tks, but I'm still waiting.... So far I got most of my support from the best BBS for Atari here in Holland and the rest from the German Mausnet. There will probably come a time when this BBS shuts down, I'm afraid and then the net will become a must anyway.

Right now I'm not so sure about everything, so don't be surprised when I got hooked up in maybe a few months or so... <G>

In the meantime I'll try to contribute thru' this Fido-gated group.

DG> But for 16 colors or less, Thing works great.

Hi Dave,

not sure what you're doing wrong... I run Thing (and Jinnee) fine in 256 and even in 16.7M colors. Thing supports 256 color icons as from v 1.20, but it has only icons in 16 colors as provided. I added a few 256 color icons myself, no problemo.

Desktop pictures in 256 colors also no problemo (it only slows down reloading when not using MagiC, plus consumes lots of RAM).

148. Re: Zip Plus SCSI woes

Newsgroup: comp.sys.atari.st
Date: 1998-04-02 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95q.980402165221.7654A-100000@swindon>
Source record: 103940
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi Guys,

Okay, here's the latest on my Zip woes - to recap, I'm trying to get a Zip Plus drive to work on the SCSI chain after my Link 2/MiniS hard drive.

Ok, I got my SCSI terminator block, and connected that to the other SCSI port on the Zip+. The Zip+ is recognised perfectly, and works perfectly, I can format, read/write files etc. But the MiniS no matter what will not work on the same SCSI bus when the Zip+ is connected (yes, they are both set to different ID's). It works fine on it's own (termination enabled), but when the Zip is connected after it and the MiniS is unterminated, the SCSI communication between the computer and the MiniS is way unreliable, even though the SCSI commands being passed on to the Zip+ work fine. I've tried every possible combination of DIP switches on the MiniS and nothing improves matters. Help!

With the Zip Plus connected, the SCSI communication works fine with the Zip+, but is extremely unreliable with the MiniS. Both HD Driver 7.1 and the ICD 6.5.5 driver software read garbled data - for example, in normal use the driver software reports that the MiniS is a "Maxtor 7213-SCSI" drive, which is correct. With the Zip plugged in, this usually is reported as something like:

"Maxxrr 7343/SSSI"
or "MXXor 7724--SSIO" or other garbled text
(it's different every time)

indicating something is seriously wrong with the SCSI communication.

(I haven't yet tried connecting the Zip+ first, then on to the MiniS yet because of the cost of the leads, but that may have to be the next thing to try...)

>any ideas?

IIRC the same thing happened to me initialy.
I tried all sorts, but eventually assigned it a key in Stoop, the F030
boot manager, booted direct into ST low res and it ran straight off.

I have a SVGA multisynch monitor which is RGB capable.
At the game start up it does a loud res switch sound then loads with
no more ado. Maybe try pluging in a TV and see if RGB output is reqd.
I suspect its auto switching to RGB on my setup.
Not withstanding the fact that this strictly aint possible :)

I disabled everything else in the auto folder and it runs fine on my
stock 4meg machine.

>Also, does anyone know if Willie's adventure has been completed? Do the
>author(s) have a web page or email address?

Isn't that by NBD (new beat development)
They certainly have a web presence and I'm sure I have an e mail and
URL for them someplace.

That is another very polished bit of work isnt it?
It promises much but then so many classy demos remain just that :(

well done to the Running team bringing this one to fruition!

Pasted from the docs.....

The New Beat Development mailing is available to everyone
interested in high quality software for Atari compatible
computers. Updates on our software as well as new software is sent
out to all members of the list as soon as they are available.

As a member of the list you will also receive news and information
about our projects on a regular basis. If you are interested in
joining the list, please go on reading.

5.2 How to join

To join the mailing list, send an e-mail to dhedberg@algonet.se.
Please include the words "mailing list" in the message subject,
and be sure to give us your full name and e-mail address. Also do
not forget to state in what form you would like to receive binary
files, both UUEncoding and MIME-Encoding are supported.

If you at any time would like to be removed from the list, just
send the request to the same address.

6 HOW TO CONTACT NEW BEAT DEVELOPMENT

By Mail:

If your symptoms include getting to the title screen and then
getting crunching sounds from the speakers, I'd been having the same
problems until recently, when I got the Falcontrol .CPX - for some
reason, my Falcon was set for STe Bus Emulation! Switching this off
seems to have solved this problem.

Now for my question - anyone heard on what's going on with Donkey
Island? I saw the demo of it at last year's UK shows and fell in love
with it, and have been waiting to buy it.

Hiya All,

I downloaded a file called CLOCKPCH.PRG,a few weeks ago.I think from Meon Valley BBS.

Anyway,I think it said something about patching the clock for compliance with the 2000 problem.
I dont know which Atari its supposed to work on, but if anybody wants a copy to play about with they are welcome to it.
Preferably,someone who knows what all the code means in the PRG.

Seeya,

Keith.

I had realised that it was a fool, but was just wanting to point out
that given similar situations around the world DO exist, there could
have been some substance behind it.

Yes I know that. I sometime use Wdialog when I need to print a web
pagina's with graphics. If I don't need the graphics I print without
Wdialog.
Note. I start Wdialog from desktop not from auto folder because
Wdialog and Thing v1.20 doesn't work very well together when started
from the autofolder. The text inside the Thing dialogs aren't
displayed. According to Thomas Binder this is a fault of *Wdialog*.
I can be wrong but I think I've Wdialog v1.98

Hmmm just a thought: this Zip+ is the one with both a // and a scsi
interface, isn't it ? So there should be one connector for the scsi port
and the other for the // one. Am I wrong or did you plugged a terminator
in the // connector ? I would be surprise if it works.

(I could be wrong of course as I only own an ordinary internal scsi Zip).

> (I haven't yet tried connecting the Zip+ first, then on to the MiniS
> yet because of the cost of the leads, but that may have to be the next
> thing to try...)

If what I said is right, it should not be possible to chain a scsi
something after the Zip+.

Bye,
/Pascal/

Hi,

When I bought my Zipdrive, i got a floppy with HiSofts 'Squirrel Zip/Jaz Tools' with it. As a bonus the Zip/Jaz Tools disk contains a version of ezBack (=Diamond Back light) to backup your harddisk to zipdisks. At least, that is what the readme says.
I've still not figuered out how to make backups to a zipdisk with this program. It looks like ezBack only wants to write to floppys.
Anyone who can tell me how to use ezBack with zipdisks?

Thanks!
Karsten

This is one clear-cut case of SCSI termination problems. Use short cables
(leads?) and make certain that the first and last items are terminated (it
sounds like you have termination at the end O.K. -- put it at the beginning as
well with either resistor packs or a pass through terminator). I went through
this garbling for months a couple of years back before figuring it all out --
not I have 4 items on my SCSI bus and they are all happy.

Help - Is there anyone who can help me with a browser that will
work with ppp?

I bought CAB 2.5 with ppp from System Solutions only to find
(after the sale!) that "Oh by the way, it only works with MagiC!
and you really need NVDI and .... " Beware of these guys!

The only connection I can get through my University is ppp.

Help! but please reply via E-Mail as I don't have a browser -
oh yea - I said that

mmarion7@ua1ix.ua.edu.

There is a file out there DM2WORKS that will convert it to Atari Works format.
Texel will probably import the converted file too.
I can email it to you directly, as I don't know where I found it.

Happy Festivus,
Dave

It is. Are you sure, in case of SLIP, that you got the VJHC setting alright ?

If so, well, there appears to be a bug causing trouble with some ISPs, which
can be worked around by setting a much larger MTU, like 1500 or even 3000.
Try those. Such MTUs have some other minor drawbacks, but they are fine as
a workaround as long as I haven't fixed that bug.

Cheers Peter

Does the MTU setting effect PPP, or is that negotiated in PPP connections?

I have been with CIS since 1984, back when I had an Atari 800XL and a 1030 modem. Plus when I was still living in Hawaii, my TT/030 had a 24 hour BBS running on it. Now that my mother who I was taking care of has passed away, I've moved back to the mainland, and now I am looking at going to the web part of the net, as my BBS is only a part time one at night now, the rest of the day, I have loads of time to do other things, like gardening, photography,etc. So I figure now is the time to look at moving off of CIS, but 1st I need to call the ONE local outfit and see if they have a number I would call that would be within my toll free ZUM calling area. Like the CIS number I call. I am on many newsgroups and as I do a lot of posting on other newsgroups, I've got to make sure I have access to them. So until I've got everything up and running, I'll keep my CIS access. IF I can get everything up and working before May 1st, then I can maybe drop CIS before that date. Only time will tell.

BTW, I am a disabiled Vietnam Vet (30%) and I live on a fixed income of $765 a month, of which over $500 goes for rent,gas,elec. and the rest is what I use to eat off of. So I have to make every cent count.

Yes, but isn't that the 'obvious' <g>. It's such a waste of time having to do the stylizing all over again, depending on the size of the original document. The simple escape sequences 1st Word Plus uses can be easily converted to tags. I've done this, including one particular document -- a film catalogue -- that had 20,000 of them. It took less than fifteen minutes to do a conversion to useable HTML.

Hi Terry,

AFAIK the later versions of 1stGuide support PNG, as do Graftool and Stella.
Stella even has the option to set the compression. I use PNG a lot in 256
colors, as files consume less bytes than they do in GIF. All my catalogs of
JPG's are in 256 colors PNG format.

Hi Terry,

just use Thing or Jinnee as your desktop. You can set "fastload" for any
application (provided it can use it). Another way is using the CHNGFLAG.CPX
that surely must be available somewhere.

John,

I had the exact same problem and it seems to be ISP dependant. Try using an older version of the TCP.STX module. I am using the latest versions of everthing with the exception of the TCP.STX. If I load that the downloads slow to a crawl. Uploads, OTOH, are faster. Peter did mention a little while ago that he was trying to find the problem. The version of the TCP.STX module that I am using was dated 10/13/97 and is 10.3K in size. If you cannot find it, e-mail me and I will send it to you.

Peter has also mentioned trying older versions of the Resolve.STX as a possible remedy.

For your CD rom drive problems, I'm assuming you've the main
things:device number different than harddrives or host adapter,
the driver.dat reflects the same number and the physical device
name matches the logical device name, and that the Apple cdrom
drives reads generic cd's. Also, the termination is only on
the last device(and there is active and passive termination too).

Just a question: Why are you staying with CIS, since they are unable to
offer you the services most other providers do, and in addition, you
can't access CIS' special services?

If they are unable to provide you a PPP TCP/IP connection, then I'm
afraid you need to subscribe to a real provider.

>now the other prg's i have in the auto-folder don't work anymore. I
>hear people talk about that some programs should be loaded before
>another, is this the problem here?

I don't know. I have never used that driver. Usually the auto-folder programs would be in C:\AUTO on your hard disk but some drivers may allow you to put them somewhere else.

>And if so, how can i create an
>order in which the programs are being loaded??

There is a program called AUTOSORT (probably available on FTP sites) which can do this for you.

Failing that you can do it manually. Copy every file out of C:\AUTO into some other folder (or a floppy disk) temporarily. Now delete every file in C:\AUTO so it is completely empty leaving only C:\AUTO itself.

Now all you do is copy each file back (one file at a time) into C:\AUTO. The order you copy them back is the order they will get executed in. ie the first file copied gets executed first, the second copied gets executed second etc. That's it.

Note 1: if ever you want to prevent an auto-folder program from executing just rename it from ???.PRG to ???.PRX - because moving or copying may change the order requiring you to go through the whole of the above again. Thus, AUTOSORT or a program like it is much recommended!

Note 2: if ever you install an auto-folder program (or an accessory) that causes the system to crash the effect will be a system reboot whereupon the whole thing (called a "boot loop") happens again forever. For this reason it is wise to find a good "boot manager". You place this so it runs first in the auto-folder and it will allow you to disable the program which crashes. Thus the machine can start up properly allowing you to remove the offending program.

Ian,

preserving all the format and style information was the whole point of
my request, so your suggestion won't work. (Even if one is not
interested in the style info, your suggestion probably won't work since
WordPlus files contain special command sequences which will be displayed
as funny characters in a browser.)

Re: "Losing memory in CAB", guy@swampdog.demon.co.uk scribbled the following
on 02 Apr 98 @ 07:18:45:

g> Have you tried the cache "Flush" button? When MagiC spots memory
g> blocks which it can combine back into larger ones it will do so.

I haven't tried that, but if the cache is only using 640k with 7 megs of
memory essentially wasted, I doubt if it will do much good. I'll give it a
try, though.

g> Do you have an url for a site this always happens on? I'd have to
g> download it on the PC and try Cab with it all on disk but if it
g> does it then maybe I could figure it out a bit more.

It's not URL dependant. It's simply the result of visiting a lot of sites
with a lot of graphics, where my cache gets full, then as I go to new sites
it flushes out old graphics to make room for new graphics. The URLs don't
matter, other than obviously those sites with a lot of graphics will do it
faster.

g> And if you run memexamn while those 7 megs were being wasted who
g> does it show as owning it and is the any consistency to the size of
g> those tiny blocks?

I don't have that program. Where can I get it?

Just looking at MagiC's Alt-Ctrl-Esc screen, I find that ICONNECT and CAB are
taking up at least most of that memory, even though CAB only shows a small
amount of it being used by the cache. When I get time, I'll take more
specific noies. I'd like to try that memexamn, too.

216. HDDRIVER 7.5 release, demo version available

Newsgroup: comp.sys.atari.st
Date: 1998-04-02 00:00:00 UTC
From: Uwe Seimet <us@ooc.de>
Message-ID: <352362A5.3FD@ooc.de>
Source record: 104130

Hello!

The new HDDRIVER 7.5 is available now. These are the most important new features:

- HDDRIVER supports both Milan IDE ports.
- HDDRUTIL and HDDRCONF (not HDDRIVER!) run under MagiCMac and MagiCPC, if CBHD or SCSIDRV are installed on these platforms.
- New SCSI driver interface 1.01.
- The SCSI driver interface supports ATAPI peripherals and emulates the most important SCSI commands for IDE drives.
- Formatting of IDE drives.
- The verify option also supports IDE drives.
- JAZ and ZIP media can be formatted even if they are read or write protectedb y a password.
- Completely new dialog boxes for device and partition selection.

As always there is a demo version available via http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html.
The demo archive comes with additional information on HDDRIVER. The English version will be available from System Solutions.
HDDRIVER 7.5 will also be available at the Atari Messe in Neuss this weekend.

IMPORTANT: There was a bug in the HDDRUTIL demo version dated 04/01/98. Please destroy copies of this version and use the new demo from acp5.chemie.uni-kl.de.

Best regards Uwe

> and it worked great.

Yes, of course, as long as you don't run SPIN! or other CD-ROM drivers
based on the SCSI driver interface. But it won't work for other ATAPI
devices or for the Milan because the Milan's IDE port is not compatible
to the Falcon's IDE port. And note that SPIN! is recommended when you
run MagiC because MetaDOS sometimes changes paths, i. e. some programs
don't find their resource files etc.

Note that with most modern hard disk drivers this program is obsolete
because the drivers offer the same settings. This is more convenient to
use since you don't have to pollute your AUTO folder with additional
programs.

> required?

ATAPI devices are connected to the IDE port. All modern CD-ROM drives
are also ATAPI devices. Note that with ATAPI you don't get full-featured
SCSI. ATAPI only offers *most of the SCSI command set*, nothing more.
But this is important because programs using the generic SCSI driver
interface as it is supported by HDDRIVER, now can also make use of ATAPI
devices. They won't see the difference between a real SCSI devices and
an ATAPI device.

Greg Malick <tiger@hgea.org> asked:

T > Is there a way on an ST to capture or redirect print output to
T > a file.

I have used Magic Spooler with some success for this. It is an auto folder/cpx combination. The dialogs are in German, which is not my strong suit, but it can be deciphered. It won't work with some programs, and I haven't tried it with gdos, but it is worth a try.

230. adding an internal SCSI to MegaST

Newsgroup: comp.sys.atari.st
Date: 1998-04-03 00:00:00 UTC
From: Greg Malick <tiger@hgea.org>
Message-ID: <352593CA.3D38@hgea.org>
Source record: 103794

Has anyone installed a SCSI HD drive inside a Mega4 ST using the ICD
AdSCSI Micro?
Any recommendations for a drive? Any FAQ's about this procedure?

thanks in advance,
Greg

Get STinG from my web page, its better in most respects anyway compared to
the "PPP" that comes with CAB.

Cheers Peter

They usually do provide a PPP connection, STinG comes with a login script
specifically for CIS.

Cheers Peter

This platform has never survived on idealism. The price mentioned comes out to around US$450 -- a good deal for what one would get. And there _are_ new 'Atari machines', as you called them.

It sounds like you're the type of person who would have "WordPad for Dummies" on the bookshelf.

I really doubt it was innocent motivation that brought him here. In
retrospect, though, my final comment -- intended more for humour -- was
uncalled-for. Perhaps others in this newsgroup will interpret his
sincerity differently than I did. To me, he said 'peace' and threw rocks
at the same time.

> now the other prg's i have in the auto-folder don't work anymore.

The "other programs I have in the auto-folder....:"

AHDI should _NOT_ be in the AUTO folder! If I read your message correctly, it sounds like you put it in the AUTO folder -- if so, remove it and everything should work properly. Atari's Hard Drive Utilities should only be run once, which installs the hard drive booter "SHDRIVER.SYS" on the root directory of the hard drive.

Yeah, but does the IDE drive really install internally in the 1040STe case?
Where do you put it? The drive in the Falcon goes where the SIMMs are
located in the 1040STe. Other that that, I can't imagine where it could
possibly fit -- and definitely not with all the RF shielding in place.
So.... where does it go? You've got my curiosity up. ;-)

Sheldon

This all sounds like a problem with termination to me. I've seen a very
similar problem that happened because of incorrect termination. Also
remember to set each device to a differend ID (although I think you
must have done that or you wouldn't have got this far)...

Modula-2 is a programming language related to Pascal.

If you don't want to use the language, I'm sure it will be quite safe for
you to remove it!

Get STinG and CAB.OVL, they will replace the PPP Connect part, and work
perfectly well with CAB 2.5.

You'll find links to those packages in the Quick FAQ.

To be more precise, it's the HDX program that installs a boot sector on
the drive, AND the SHDRIVER.SYS file.

However, if he is booting off of a floppy, then he needs to have AHDI in
the auto folder, because some TOS version will not boot from some drives.

You are using Newsie 0.86 which avoids displaying all the coded stuff.

You SHOULD notice the header lines of the UUE or MIME in the
mail/message but the rest will not be displayed. This does not affect
decoding which will work as per normal.

I thought that Pinhead was a TOS hard disk fix for TOS ~1.0-1.02? Do
you really need it with MagiC?

Can anyone give me any details in installing the new version of debian, i have downloaded the boot and root files and also the 7 meg binaries file. I just need a bit help installing it

Thanks
D.Rutherford

Hi All,

Pinhead works fine with magic I have been using it for years. Run it
after magicboot and xboot or what ever and all loads fine (I use the
last version available 2x i think)

Machine TT 030 4x4 connor 105 internal and a quantum 1.2 external.
MagiC 5.11 NVDI4.11 r9

Hi
Having the proxys in the dial src is right also in cab click on the proxy entry menu and then chick on the defaults button this will load them into cab for its use this works. I have a server which will nor accecpt the commands from cab unless this is loaded this way. My other provider works either way.

I guess you are right, but I don';t know anyone wh ohs got a "magnum" board and
it's not realy "fast" in the same respect as on the AB040 or MS030. It's still
16-bit 16MHz access to it while Fast-RAM on the other cards are 32-bit 32MHz.

I'm not even sure that it works with the Nova card.

HTML format is intentionally pure ASCII, so any WP which will save in
ASCII without control codes can be used to produce HTML files.
```

Core Design, Bullfrog and Bitmap Brothers, eh? Three funky development teams that started out on the Amiga and ST and then went on to make a huge dent in the gaming world (well.. maybe not huge in the case of the Bitmaps, but you get the idea..)

I now have articles on all three on my site, the anally retentives retro games home (arrgh for short) and would be grateful if some of you wise and all-knowing people could cast an eye over them to see if you have anything to add or check I haven't made any obvious bloopers or summink.

the url is http://www.arrgh.demon.co.uk and follow the 'people' link to get to the relevant pages.

I thank you and good night.

But you would need some experience in C-programming and deeper
knowledge about (or at least interest in) the IJG sources, a
combination which I didn't find common in the Atari domain.

> NO display jpeg though.

You could send a message (VA_START or MinT-compatible AP_DRAGDROP)
to 1stGuide for JPEG file display :-).

> as known as unix for example? ;) or?

platform-independent, that means *all* platforms, no specific one,
if possible, for maximum portability.
BTW, I also placed Win32 (Win95) executables of the new v6b release
into the given jpeg-bin folder, since this was requested some time
ago by several digital camera users in the rec.photo.digital
newsgroup.

I have been experiencing the same problem. Increasing the MTU to
1500 did not improve the situation. John solved his problem by using the
previous version of the TCP module which I am going to try tonight.

hmm I don't get it. Why need knowledge in the IJG sources?
What I might want to do is just a shell to run YOUR ttp.
Just need to make an interface, then pass the arguments (pexec for
example) to your ttp. I don't want to include your C code to the shell
for several reasons, 1) that if you upgrade the ttp, the shell will
still be useable as is (unless a new flag appears).
However I might then need you to incorporate a -quiet or -verbose (as
oppposed to -quiet) flag into the ttp, so there is no output on the
screen. (just cleaner from a GEM shell).
See what I mean?

>You could send a message (VA_START or MinT-compatible AP_DRAGDROP)
>to 1stGuide for JPEG file display :-).
Yes could to that, a simple av_start_program().

My main question was about, If there is NO shell developed on, is it
worth it to start one (considering I would do the job).
Bye :)

262. GDOS Fonts questions

Newsgroup: comp.sys.atari.st
Date: 1998-04-03 00:00:00 UTC
From: Guentcho Skordev <ut13@rz.uni-karlsruhe.de>
Message-ID: <6g33n0$1s9$1@nz12.rz.uni-karlsruhe.de>
Source record: 103922

Hello,

In the near future I will make some cyrillic bitmap (8x16) fonts and I want to put them on the net for everybody who is interested. And here comes one problem: in the font header stays a place for a font ID number. I've read there is no standard about this numbers. However, I would like to know what numbers should I assign to this fonts. What do you do in such cases? Is there a problem if the numbers of two fonts are the same, is there a tool to avoid such situations?

And a second question: does anybody know a tool to convert "VGA" fonts (simply saved bitmap images, e.g. 1024 bytes) to GDOS fonts?
(The fonts mentioned above are already made using an editor for GDOS fonts. But that information is interesting to me too, so I just ask before trying to write such program myself.)

Bye
Guentcho

I feared that you thought about this way, and I personally
don't like this. A standalone program with direct GEM
interface to the IJG library would be my desire.
See my Web interface to (a subset of) jpegtran at
http://www.reporter.de/jpeg-lab.html as example for
an alternative (standalone) jpegtran interface.

> I don't want to include your C code to the shell
> for several reasons, 1) that if you upgrade the ttp, the shell will
> still be useable as is (unless a new flag appears).

Code updates would be no problem if using a reasonable C interface.
Note that the IJG primary update product is the source code, not
the system-specific binaries, which are considered secondary.
Thus, new source code is always available prior to new binaries.
And to utilize the new source code, you need to be familar with C
programming and with the IJG interface, that's my recommendation.

> However I might then need you to incorporate a -quiet or -verbose (as
> oppposed to -quiet) flag into the ttp, so there is no output on the
> screen. (just cleaner from a GEM shell).
> See what I mean?

Well, what you need is an *appropriate* way for output message handling.
And this is exactly what the IJG C interface provides: You can define
your own (trace/warnings/errors) output message handling routines,
according to the application and type of user interface.

> >You could send a message (VA_START or MinT-compatible AP_DRAGDROP)
> >to 1stGuide for JPEG file display :-).
> Yes could to that, a simple av_start_program().

I always use 1stGuide as ACC, so I wouldn't need a program launch,
just a message to pass.

> My main question was about, If there is NO shell developed on, is it
> worth it to start one (considering I would do the job).

I wouldn't prevent you from doing this, but I'm afraid it wouldn't
quite meet my requirements in the way you suggest.

Regards,
Guido

Aloha,

Is there a way on an ST to capture or redirect print output to a file.
I have a HP LaserJet III at work and I don't want to lug my ST in just
to print.
I was hoping there was a software method to just bring floppies from
home and on my work PC to do a cCOPY filename >LPT1: and get some good
printout.

Why would you need any of that to write a shell? All you would need to know
to write a shell is knowledge of SOME programming language and the docs for
the executables to tell you what switches do what.

270. The Milan

Newsgroup: comp.sys.atari.st
Date: 1998-04-03 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn6i9pfc.b5m.mlake@melake.erols.com>
Source record: 103930

I saw that the Milan was supposed to debut at a German computer show in March. Does anyone know if it actually did? Impressions?

271. ST Informer Magazine returning to the web

Newsgroup: comp.sys.atari.st
Date: 1998-04-03 00:00:00 UTC
From: stirrell@portland.com
Message-ID: <stirrell-0304981434180001@portland15.portland.com>
Source record: 103931
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.ataralt.atari-jaguar.discussioni.programmer,alt.atari.2600,rec.games.video.atari

First of all, please excuse me for cross-posting this but I thought it concerned all Atari owners. ST Informer Magazine is set to return soon in Web format. Many previous subscribers probably know that ST Informer's web site has been stagnant for awhile. Well, I have just been appointed Web Editor of ST Informer and hope to change all of that with monthly issues of ST Informer. Issue 98 will be posted shortly. For those who want to be kept updated, please send me an e-mail and I will add you to the ST Informer mailing list.

What will ST Informer include? I plan on having letters, Rod's trademark Potpourri column, news, interviews, and product reviews. What Atari products will we cover? All of 'em with a focus on the computer line. This will include pictures (though they will not be bandwidth-busting). There will be no Java or animated GIFs so that we can concentrate on the information and to make this site available to all (even those with slower modems like myself).

This, of course, cannot be a one person show. First of all, I don't own all Atari systems. Secondly, I just don't have the time to write all of the articles, lay out the pages, etc. I am asking for volunteers interested in writing for the magazine. The benefits include, er, fame and, um, prestige. Seriously, it is fun and those willing to put in the time will be first considered for review products from vendors. All submissions are welcome so please send your articles to me at stirrell@portland.com.

For advertising information, please send requests to Rod McDonald at stinformer@chatlink.com. He will be happy to send out information. Also, to get your products reviewed, please contact me atstirrell@portland.com. I will make sure that they get to a reviewer as soon as possible.

If you have any comments or suggestions for ST Informer Magazine, don't hesitate to write to me. I really want to hear from you and, as a community, make this new venture a success for all Atarians.

Sincerely,
Scott Tirrell

272. FS: ST Soft/Hardware (3/4/98)

I have a selection of Atari ST titles for sale.

This List Updated 20/3/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins
and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'
Atari 520STE Discovery Xtra Pack 5
Language Disk DE1 (ds)
Final Fight Disks DE2 & DE3 (ds)
Sim City/Escape from the Planet of the Robot Monsters (ds)
9 Lives (ds)

SPORT TYPE GAMES

World Championship Soccer (1d,ds,nb) 2
Ballistix (1d,ss) 2
Superleague Soccer (1d,ss) 2

From: outrider@anv.net
Message-ID: <1444_outrider@anv.net>
Source record: 103934

Did anyone ever get any docs on this? If not, has anyone completely figured it out?

There are times when I'm able to use it successfully. However, there are other times I have no idea why it's working or why it's not working.

Anyone have a clue how I could use it to filter out the following ad:

```
href="/cgi-bin/redir?SpaceID=53&AdID=618&URL=http://www.fastball.com/FEATU
RES/games/superfastball.html" target="_top"><img
src="http://netgravity.cimedia.com/468x60/superfast_ad468x60.gif" border=0
alt="Play Super Fastball" width=468 height=60></a>
```

Not that this ad changes constantly.

Neither Host nor Path /cgi-bin/redir? works.

I'll agree with you on Linux but OS2 is as big as dog as Windoze 95. What you need is an alpha system running Windows NT.

It should run fine although not fast. Opera only supports Jscript right now. You might want to try the 16bit version of Netscape 3.0 that does support Java.

In article <6fq5r5uig1@brokaw.wa.com>, csilver@kendaco.telebyte.com says...

I've done it, but it was years ago (the 213MB drive I installed cost over $400). It was a pretty painless experience and it worked really nicely.

Depending on power consumption, you may find that the internal power supply isn't enough. If so, contact Best Electronics and see if they still have the "Best Power Supply". It'll fix all your problems.

I can think of two possible solutions:
1) Use NVDI which directly supports writing print files to disk or
2) Use a print Spooler which saves the output to disk, Multiprint should be able to handle this and I suspect it might be possible to get Gemspool to do it as well.

Hope this helps
David James

The apparent two versions of softpc (one 1.2 meg and the other a couple
of hundred K) appears to be only that the shorter one was compressed with
a program called ICE!
I have been in contact with Insignia, and the head honcho in calif. is
now on a trip to the london office, and he is trying to find the "latest"
version in the company. Whatever the outcome, and he will be back in the
states in a week, I do have their official permission to post it
publically with the "right" files, thanks to you, on any Atari archive. I
plan to do this on umich, funet and lip6. I will also update raymonds
"poop sheet".
Unfortunately they never did anything to allow SoftPC to access more
than 640K, so its unlikely the post on the otheer browser is relevant,
besides being way too slow.

285. Hard Disk file copy to floppy problem

Newsgroup: comp.sys.atari.st
Date: 1998-04-04 00:00:00 UTC
From: jregan@idirect.com
Message-ID: <jregan-0404980229380001@ns.compulink.com>
Source record: 103805

Hi,

I use a Mege 4 STE.
I have no problem copying and filling up one floppy disk.
When inserting another empty floppy, I get a not enough memory prompt.
The only way I'm able to continue is to shut down and reboot. I then am
able to fill up one disk only.
I'm using new DD Maxell IBM formatted disks that are read with no problem
on my Mac.

Any help is appreciated.

Why don't you go into http://babelfish.altavista.digital.com and do a
translate? It does quite a good job you know!

287. Looking for used Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-04-04 00:00:00 UTC
From: asylum288@aol.com
Message-ID: <asylum288-04049802154300001@ip34-020.bur.primenet.com>
Source record: 103807

I'm wondering if anyone knows a good place to find a used Falcon. I am interesting in basically just using it for the bitbopper and so I don't really need a lot of software for it... of course, I actually know very little about the OS. I have been messing around with the Mac ST emulator "NoSTalgia". I have not been able to run any tests on it though...

Thanks...

I believe NVDI can print into a file. Otherwise if you're using MiNT you
could redirect all output to the parallel port into a different device.

I've actually just done this with my mega and its very easy. The drive
I used was a quantum 105meg and its basically a plug and play
operation. I think my drive is a half height drive but most drives are
half height so are suitable for use. Parity has to be disabled but
this is normally a case of removing a jumper on the drive.

Well believe it or not, you don't actually need MagiC, get STinG and the
STinG version of the CAB overlay (CAB.OVL) and you'll soon be browsing.

You can get those two progs from PD libraries such as the FaST Club.

The Shareware GEMSpooler works very well here, just set the queue status to "stop" before printing.

Just in case anyone's still wanting to use the Atari SLM laser printer with a Falcon or other computer, and assuming that you still have the ST and a monitor then you might like the utility magicslm.acc that will take an HP printed to disk file or data sent to the serial port via null modem link.

Could you give a pointer as to where I might grab this from please?

It sounds more integrated than my current spooler.

>folder/cpx combination. The dialogs are in German, which is not my
>strong suit, but it can be deciphered. It won't work with some
>programs, and I haven't tried it with gdos, but it is worth a try.

Some programs print directly to the printer port which will bypass the spooler. Calamus SL is one, but the "other" button in the printer dialogue box will print via the "official" routines BTW.

Greg,

If you select the correct printer driver for the printer at work
and than print your finished file to the disk instead of the printer than
you can take your disk to work and do a
COPY filename.ext LPT:1
This will than send the your file to the printer. Make sure that you save
your file with the print driver that you intend to print this file on. If
not you will get garbage.

Example you want to print on a HP Laser printer at work

Create your document and than print it to a disk file using a HP laser
printer driver

Now take that disk to work and tell your system to COPY {filename.ext}
LPT:1 or which ever port your HP laser is on. It is really quiet simple to
do. I do this same sort of thing here all the time till I got Pacifist
running on the machine at work.

Hope that this helps you out

"and assuming that you still have the ST and a monitor " WHY whould you assume that anyone does not have a ST and a monitor? You know NOT everyone has or wants a Falcon or a TT or the dreaded IBM. Why make assumptions about what equipment people have. I for one am really happy with the Mega STE that I have and see or have no intrest in upgrading my machine at this point to a Falcon or TT.

Hello I just bought an Atari Mega ST4 at a flea market for $15 dollars today and would like some info on them.
The system came with an Atari SLMC804, and an ICD FA*ST SCSI hard drive box.
My first problem so far is there is no monitor or mouse with it. And I would like to know if it is possable to connect it to an old Amiga monitor? The Amiga monitor is capable of RGB or composite input. I've found some plans so far for hooking it up to a NEC multisync II monitor which I have but would rather use composite at this time.
Thanks for any help you could give.

>a faq or howto file, what is there to be done to get this working?

I've got stuck, and I was really close. Naturally, the problem is just about all on the NT side. I got as far as NT listening for an inbound connection, seeing it and picking up the line.

The next stage in the plan was to install STiNG the next weekend on the ST but unfortunately I had an independant problem - the end result of which is the PC serial ports have all had to be disabled and for the life of me cannot figure out how it happened or what is causing it. I digress. With NT workstation a loose description (in no particular order) is (and some NT rebooting is required) (oh and yeah, you must be logged on with Admin priviliges) ...

Ensure NT knows about the com port you will use to the ST (settings etc need to be compatible with ST port). You can check this with a comms prog on the ST and Hyperterminal on the PC.

Install a new modem and in the list of modems and select the one about a "serial connection between two PC's" (top option) rather than a make and model of modem from the list. Specify the com port. Ensure the networking protocols only use TCP not NETBUI or any of that garbage.

You need to tell RAS the connection is "dial-in only" (may work both ways but don't push your luck yet) and to use manually specified IP address assignments which you'll have to assign. I'm sure there's a reboot after this. When it comes back up check the event log to make sure there's no conflicts (so easy to do). Now ensure the RAS server is running - mine wasn't by default. Just start it manually. If in doubt start anything that will start! (manually though, don't do "auto" else it'll all be running forever thereafter). You can figure out what is needed "auto" and what isn't later.

If things are going to plan the dialup networking monitor should now list the port to the ST. Bring it up and see if it is listening. It should be. Run Connect or similar on the ST and get it to send something down the line. You should see the dialup monitor respond by picking up the line. If so, you have got as far as I ever did - and the next stage would be to try STiNG.

Alternatively, it might be an idea to try two PC's together like this to figure out anything else that might need doing with NT for successful communication. More info might be forthcoming, especially if one of them is a '95 machine. Then try STiNG.

I would suggest writing down *exactly* what you do so (a) it can be undone and (b) if you are successful you can tell the rest of us what you did!

Good Luck!

[sounds like a game solution doesn't it?]

It is possible that 640K is split up into lots of little blocks
scattered all over those 7 megs. memexamn will show this.

You already have it. Look in the UTILITY folder, or on the
installation disks as you may have selected not to install it. iirc
you'll find it in the same place as LIMITMEM.TTP etc.

>Just looking at MagiC's Alt-Ctrl-Esc screen, I find that ICONNECT and CAB are

Unfortunately not.

>I use Home Accounts so would love a patch. Also Harlekin's
>manager doesn't go beyond 2000.

It would be a bit like detective work. Ideally you'd first want to
know what language/version was used and if you were really lucky get
some response from the author (unlikely in most cases though).

Knowing the language leaves three situations:

1) There are dedicated time and date routines built into the language.
2) Direct system time and date calls were made.
3) Both the above.

(3)
Would be a real pita and is unlikely in any case.

(2)
System time is an offset from Jan 1 1980 thus the code would need to
be adding either 80 or 1980 to the value returned for the date.
Perhaps these offsets could be located and increased.

(1)
The language has dedicated time functions as do C compilers. Knowing
the language allows the offset used to be known - MWC offset is from
Jan 1 1970 for example. Perhaps these functions could be patched
similar to (2).

The crux is how the program compares dates. It doesn't matter if it
prints out 1900 when the year 2000 arrives provided that 1900 is
internally greater than 2000. I know that sounds daft but it is
possible.

The most likely cause of failure is lazyiness (or lack of forethought)
on the part of the programmer. The actual values returned from the
system date function should be compared but if the programmer has
chosen to convert these values to a date we understand like 1998 and
truncate to two digits then there's a real problem because
comparisions will give the wrong result.

Yeah. Write a decent formatter for NT but I don't have the knowledge.
May well be possible but it would not surprise me in the least to
discover it isn't possible due to the HAL (Hardware Abstraction
Layer). This is responsible for preventing NT processes directly

accessing the system hardware. I guess there will be a format system
call but this would probably be exectly the same routine that the NT
formatter uses anyway, so unless there's some options to make it less
finicky then there'd be no point.

Come to think of it. I think KnifeST might sometimes do a better job
as iirc it writes "MSDOS" into the bootsector. Not that it should make
any difference!

Not so, I'm afraid. When you reboot the battery clock it will revert to
2028. I have written a little program in GFA basic which reads the year
and resets the *system* date every time you reboot. Alternatively you
could fit a better clock.

I did years ago. It was very simple and it worked very well. The only problem I had installing it was that one of the legs was supposed to line up with a hole or something and it didn't. I propped it up in some way and never had any problems with it.

I can't remember if there were any limitations as to drive. I looked just now for the manual but I can't lay my hands on it. If you are buying a new drive, System Solutions or other company should be able to advise. If you are buying second hand, Cyberstrider (Denesh Bhabuta) was offering a couple for 30 and 35 UK pounds in this newsgroup a couple of weeks ago.

I've tried running Running (!) on my TOS 4.02 Falcon and it complains
that there isn't enough memory. Something in the manual suggests that
it may be my older TOS version that is causing the problem and that
TOS 4.04 would be ok.

The manual also suggests that the full version of Running will not
have this problem.

Before I buy the full version, does anybody know if it will run on
TOS 4.02?

Cheers! Simon.

Aloha,

I think a software solution is required here.
Atari CUBASE just prints. I can't save to a file.
I'll need an accessory to intercept the print out
(of course I'll have the printer set up for a LaserJet)
Has a driver for a LaserJet III been made for the ST?
If so, where could I find it?

Also, InfoSeek couldn't find anything on:
GEMSpooler or
Multiprint or
Magic Spooler (except 1 reference which I wasn't granted access to):

Is there a site where I could find these?

sincerely,
Greg

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

I need to contact an user of a MEGA STE 4 with german keyboard, or even
better with an french/suisse keyboard (clavier franco/suisse =
qwertzuiop ï¿½ï¿½, ï¿½ï¿½, ï¿½ï¿½, ï¿½).

I need help on the TOS of this computer.
Even if you are only an owner with no special tos experience please
contact me at:
gerard.biever@ci.educ.lu

Thanks

Hi Gerard,

I've got a bit of knowledge on many versions of TOS, what's the
question?

331. txt-file transfer ste-PC

Newsgroup: comp.sys.atari.st
Date: 1998-04-05 00:00:00 UTC
From: gerard biever <gerard.biever@ci.educ.lu>
Message-ID: <3527EE99.C52CC0F1@ci.educ.lu>
Source record: 103743
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Trying to tramsfer my Atari-txt-files to a PC for laser printout I lost several characters.

My ATARI is an MEGA STE 4 with french keyboard, the PC has French/swiss keyboard. The changed characters are special french characters only like ï¿½ ï¿½ ï¿½ they are replaced by other ones.

Hope that somebody has an idea how to get the right characters or to transcript the atari txt files.

Thanks
gï¿½rard biever

Yet another good software from Soft JEE is now supported and sold in Sweden.

Pretty Midplay is a Midifile player for your external devices.
You can play one midifile, a directory of midifiles or make your own playlist.
You can mix/mute all the channels.

There is also a "plug in" record module availible for Pretty Midplay.

Please go to http://home1.swipnet.se/~w-12411 or come.to/kockensbbs
for more info and screenshots, or to make your order. Press the Onlineshop button.

Oh, the price for Pretty Midplay is 200SEK and the record module is 220SEK.

Hi

It could be that your CAB.OVL is damaged or an old version. Are You using PPP connect? If so Niall i'm
sure ASH can replace it for you.

If it is old then if you are using STiK or STiNG then take a look at

http://www.flinny.demon.co.uk

for a newer version, I just did and everything is fine and dandy :)

In article <1394_outrider@anv.net>,
outrider@anv.net (Terry May) writes:

> Does the MTU setting effect PPP, or is that negotiated in PPP connections?

Usually yes, that is if the ISP's PPP sends it's MRU (basically the PPP name
for MTU). Otherwise, the number specified in the SCR is used.

No, it does not effect PPP.

The TT030 clock battery is located at the back of the motherboard
just behind the hard drive access cover and ST RAM expansion slot.

It is a standard PC battery type the original is TL-5242/W;
alternatively you can use a COMP-8P.

HI all

Change flags does not work for magic it is multitos only.

Use GD_FLAGS97 this works in the magic environment and sets all the
flags with a mouse click. If you cannot find
it I can mail it to you.

Isn't this a little harsh? A person is away from this platform for a while, and wants to know where things stand, so he is insulted?! I do think there was at one time a little bit of idealism in Atari (hence the "Power without the Price" motto). There was an innocent motivation behind his question. Let's offer people like this a little help instead of rudeness. Isn't that what this newsgroup is for?

Are you backing up the Hard Drive?

I sometimes get an "OUT OF MEMORY" message with the advice to use
FOLDER100.PRG. This will sometimes happen when backing up the Hard
Drive and accessing a LOT of folders.

It's pretty rare though, and I don't use FOLDER100.

I too have been having problems with the last 2 versions (0.84 &0.86)
of Newsie; ie. when exiting an editor and returning to Newsie.

If anyone else has had this problem, please contact John the author
ideally giving him as much info as you can; STFM/E, TOS version,
memory, the editor and as much as you can on what happened leading up
to the problem and when the problem happens.

If no one reports problems with software DIRECTLY to the author, how
can the problem be addressed. At least it's nice to see that I'm not
alone:)

Help the authors help us:))))

Cheers! for now
Steve

Anyone interested in buying the following mags from me?

ST Review Magazines
With Disks (without - 33)
5, 7, 7, 21, 26, 27, 28, 29, 30, 30, 31, 32, 34, 35

ST User
Ranging from Volume 1 issue 1, to the last but one issue October 94.
Around 72 mags in total, including all cover disks where applicable.

I am contemplating selling my full sets of ST Applications, ST Revieww
and ST Formats - dunno yet - but make me a good offer and they will
probably be yours. ;)

Collection from Essex, London or manchester - otherwise a hefty
postage charge.

You cannot use the CAB.OVL distributed with CAB v2.5 with STiNG - it
is built for I-Connect.

You need to replace it with Dan Ackerman's .OVL v 1.2805 is the
latest (I think).

> TOS 4.02?

Well, I achieved to run the demo version on my TOS 4.02. The problem was
that it was asking ALL the possible memory in the Falcon, and even the space
taken by my hard disk driver. So you can try to boot with the ALT key
(ignoring the HardDisk), and then run AHDI by hand from your language disk,
or if you have HD-Driver 7, you can press the escape key during the boot, it
should also be ok... :-)

Or you can use the program "Godload" put out by the Reservoir Gods. This nifty little program goes on your desktop; then you just pull any program you want to run on top of it and Godload will look at the program, reboot the computer, and free up all the necessary memory that the program requires. Works very, very well.

This is often a symptom of the wrong CAB.OVL. If you're using the one
that comes with CAB 2.5 you're using the wrong one: that only works
with ICONNECT. If you can't find a recent one for STinG easily (due to
inability to access the web :-)) drop me a mail (NB: read sig below
first!) and I can UUE it to you. You need 1.25 or later for use with
STinG, IIRC.

If you are using a hard drive you may well have extra folder memory
allocated in the driver, so you wouldn't need FOLDER100. Depends on
the driver, though. ICD and HDdriver do this, I suspect AHDI doesn't
(never tried it though, so can't be sure).

Yet another good software from Soft JEE is now supported and sold in Sweden.

Pretty Midplay is a Midifile player for your external devices.
You can play one midifile, a directory of midifiles or make your own playlist.
You can mix/mute all the channels.

There is also a "plug in" record module availible for Pretty Midplay.

Please go to http://home1.swipnet.se/~w-12411 or come.to/kockensbbs
for more info and screenshots, or to make your order. Press the Onlineshop button.

Oh, the price for Pretty Midplay is 200SEK and the record module is 220SEK.

Yes, I auto-translate the text of a magazine into HTML with contents
list and all. Bear in mind that, originally at least, HTML was supposed
to permit files to be viewed without making any assumptions about the
capabilities of the target machine- line length, font size and so on.
There should be limits to the extent to which layout information can be
expected to be preserved.

>
>Nope!
>
The boot sector of a PC-formatted disk starts with a two-byte 80x86 jump
instruction for auto-booting from floppies. A data disk has this too,
usually leading to a small program on the boot sector which reports an
error if you try and boot from it. The PC checks that the first byte in
the boot sector is EB (short jump) or E9 (long jump). The Atari
formatter used to load 00 into these two bytes- later ones (TOS 1.4 and
above) load E9 into the first one for compatibility.

Bytes 08-0A on the ST are used for the disk serial number, a 24-bit
number used to distinguish between disks. On the PC, bytes 03-0A hold
a name writen by the formatter, e.g. 'MSDOS3.3', which is liable to be
the same for all disks and can cause problems with the ST. The
corresponding area on the ST boot sector is bytes 02-07.

Information from the manual to KnifeST, which knows about these problems
and can deal with them.

Hi,- I did use Newsie before, up to version 0.82, but never had this
happen to me.

It was on a Falcon, and with QED as editor. The QED version 3.97, as I
don`t like the interface of the new version 4.1.

```
The amiga monitor should be able to display RGB (not composite, the Mega has
no composite output AFAIK) but only mid and low res. The NEC is a FAR better
choice, because it's the only monitor that will display all 3 ST
resolutions. No other monitor will do that.

Cheers,
Nick

>
>Hallvard

I seem to be one of the "no problems" mob, whether the floppies are
formatted on a PC or ST.

Perhaps I don't suffer as both my internal and external floppies are HD
1.44 Mb and I use TOS 2.06. I keep a DD 725K external floppy for backing
as my Diamond Back 2 dosn't not recognise 1.44 versions.

I have seen no reference to whether the PC compatible/not compatible
discussion touched on the capacity of the floppies. I get the impression
we all assume they are doubel sided DD 726K versions.

Is this an issue in this discussion/earlier thread?

John

Source record: 103698

Hi Folks,
I've just got NVDI 3 and I've been trying to set it up. The manual just says to run Install.prg and it should be there. Well I did that and it's created a new folder called BTFONTS, and it's put NVDI.INF in my root directory along with an ASSIGN.SYS, and it's put some CPX's into X-Control for me too, unfortunately when I try to run it (Oh BTW, it's now the first thing to run in my Auto folder after Superboot has done its thing) I get an error message about not being ale to find the driver for the resolution it's in during boot (monochrome or something similar) This is with a boot that is devoid of anything except Superboot and NVDI. The manual blithely assumes that you can go straight from an install via a reboot to configuration with the CPX's, but I can't....The Falc's got a fair number of hard disks (170Mb IDE, 170Mb, 210Mb and 1Gb SCSI, CDROM (Extendos running a 6-speed Panasonic) and a tape drive (Tandberg) it's a 14Mb system, it has a Nemesis, but the problems arise without Nemesis being active, the monitor is a 17" NEC MultiSync 5FGe....

ANy help gratefully received....

Thanks for your bandwidth...

chrisc

There's always Ruftrade (now released PD) - look for
RFTRD2QN.ZIP(LZH). There is also GER2EN30.ZIP(LZH).

Both of these do german->english (of sorts!) only.

Well, that comes close to my idea: Use the ttp's for automated shell
processing in batches ('shell scripts' under Unix), and write your own
alternative (GEM-)GUI for interactive purposes with the C library interface.
Because of the GUI part, the latter requires much more efforts, naturally,
if demanding a comfortable solution as I would desire.
That's why I abandoned the project, and I only wanted to warn you of that
effort ;-)...

You are correct, NEWSie will crosspost. But it is not easy, because
it is a manual process. If you really have to know how, send me email,
and I will tell you.

Seems silly somehow to keep features a secret...

405. --> MEGA DISCZINE issue 2 now avaliable <--

Newsgroup: comp.sys.atari.st
Date: 1998-04-06 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6gbdge$nb3$2@heliodor.xara.net>
Source record: 103709

Greatings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there.

www.users.globalnet.co.uk/~mega01/

Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

If you would liked to be mailed issue 2 then send you E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site in a few days.

Please contribute to MEGA and support it, else it will be one more nail in the coffin for ATARI.

All comments and suggestions are more than welcome. Please feel free to mail me at any time.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about.

Mail me at. mega01@globalnet.co.uk Now for issue 2.

Chris Swinson.

406. ---> UFOST issue 2 now avaliable <---

Hello all ATARI lovers.

UFOST issue 2 now avaliable by Lee Round. UFOST is another disczine
for the Atari range of computers.

UFOST is a new UFO based zine covering all UFO abductions, encounters and
sightings plus a lot more.

Keep an eye on my web site for issue 2 or mail me if you cannot wait.

Please take the time to send a letter to Lee else he may not produce future
issues, Currently he has almost compleated issue 3.

If you want issue 3 then send a letter to Lee (not on the net as yet) and
request it from him. Issue 3 will be uploaded onto my site, but not for a
while yet.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,

From: nameerf@flash.net
Message-ID: <6gbdc8$hs8$1@excalibur.flash.net>
Source record: 103712

I've downloaded the latest Bad Mood version, as well as Patrice Mandin's (sp?) Doom for Falcon. How do you get them to run? I downloaded some WADs from the Bad Mood page and others, but BM says it can't run the IWAD, and Doom says it can't find the PNAMES. Do I have the wrong kinds of WADs? What do I need to do to get these to run? Thanks!

nameerf@flash.net

409. ST Plus Fanzine Issue #3

Newsgroup: comp.sys.atari.st
Date: 1998-04-06 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998040620523801.QAA22777@ladder03.news.aol.com>
Source record: 103713

ST Plus Fanzine Issue #3 (or Issue #28 if you count the previous disk versions) is now available from THE COMPUTER DUNGEON.

Another excellent edition from the entire staff, this 36 page issue features:

*reports on the Atari sale to Hasbro
*Interview with Mark Butler
*HTML Tutorial
*DTP Hints & Tips
*STOS Corner
*New Columns - Education and Do-It-Yourself
*Reviews of Atari Computing #8 & Disk Magazines
*Falcon Zone
*and much, much more

ST Plus Fanzine costs just $2.00 (which includes shipping) or is FREE with any order you purchase from The Computer Dungeon.

To order Issue #3 or for more information, call us at 708-547-7085 or check out our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm

Thanks for taking the time to read this and we look forward to helping you with all your Atari needs.

I'll play it safe and buy an exact replacement instead of any simple
battery mods.

Besides the battery going for the first time, I've also noticed the TT is
'creaking' alot these days. I guess when it's been on for a while the
heat causes the plastic casing to shift, making for some loud noises at
times (loud enough to 'startle'). This is especially noticeable after
powering down... sort of like a wood-framed house settling after a hot
day. By touch, the top only gets slightly warm, so it's not a fan problem
or anything. These noises seem to have started after installing
additional RAM (more heat). But now that I have all the casing's screws
off, awaiting a battery replacement, the creaking noises are gone. I'm
going to leave it that way <g>.

If you've the HD space then record direct to disk from your tape
recordings and clean-up with a good sample editor such as Zero-X.
Zero-X has a filter specifically for de-hissing and de-cracking as well
as high-pass filters and noise gates. Then record back to tape or
better still DAT etc.

Jim.

Does anyone know if there are any modifications that can be made to the
STe audio system to clean it up? I know the hardware limits things to
8-bit samples but even when idle the amount of noise that comes out of
those jacks is horrendous.

417. Re: PC vs Atari Relief!

Newsgroup: comp.sys.atari.st
Date: 1998-04-06 00:00:00 UTC
From: garn9114@kutztown.edu
Message-ID: <6gbkt9$p9j$1@jake.esu.edu>
Source record: 103721

I for one, must agree that I use my Atari as a gateway from other
OS's. My only drawback is the relative instability of some pieces of
software. The Sting/Internet combo is fairly stable now, but not always,
and it only came after a long time. Ditto some other quirky things that
I get on my Atari and not on a PC, especially running Linux. Windows has
the games, by far, but they also have a certain degree of "stability", at
least in their internet capabilities.
However, the thought of using it full-time kind of throws that
thought out of the window. There are times when certain bugs creep their
ugly heads around the Sting/Cab/Cab OVL package, and when they're at
their worst is when I really start debating on throwing away my Atari and
buying a PC. I came close a couple of times already. But I always come
back to the ease of use, the relative speed (of course taking into
consideration a 1992 machine vs a 1998 machine), and the fact that
Windows 95 or even Linux does not give me and OS the way I want an OS.
I want to access drives via pictures, I want to use graphics for
everything instead of typing, I want an OS (and even the regular
software) that works out of the box and lets me configure and tweak it
later. That, over anything else, keeps me coming back to my Falcon.
I'll take Gem over "My Computer", or a "Start button", or "cd
/usr/users/home/..." anyday. I'll take software that works out of the
box compared to Window's lack of tweaking ability, or Linux's lack of
working at all without days of painstaking configuration. I like the
fact that my software always works right from the start, but lets me
tweak it and get it exactly the way I want it later. I like clickable
drives! I like icons! I like true 'plug and play'. I like the fact
that my computer is the *perfect* mix between the mixed up, archaic PC
world, and the easy, hand guided Mac world. I have enough 'plug and
play' to make sure everything works the first time, but I don't have the
'Where is your modem, COM4 or COM2?' pains (anybody who's seen
Soundblaster installed knows what I'm talking about even more). We have
the best of two worlds.

Well anyway, there's my $0.02. Keep the change, buy yourself
something nice :)

George

oh no doubt that ttp are extremly useful and allows things that gem by
itself can't do/offer.
Hence why not having a gem interface to drive the ttp, the ttp is
still there for your useage. I don't see the correlation.
Both can be used depending your needs, But as you pointed out and some
other confirm, no need for GEM interface really, that's cool with me
:) just asking :) besides that will save me time and effort :)

Hi Mike and Nicole

I've downloaded BADMOOD a while back and the readon is this, (please someone
out ther correct me if i'm wrong)

BADMOOD and DOOM take all the data in the levels like sounds, wall textures and sprites
from a main (often large) file called an IWAD, in your case this the 800K BADMOOD.WAD,
The original doom and Doom2 use an identically structured IWAD which not only contains
the data for one level like the BADMOOD demo WAD but has all the sprites and sounds for
all of the other levels too so it ends up being about 14 megabytes!

The WADS that are giving you

"THE SPECIFIED IWAD IS INCOMPATIBLE"

are extra levels if you wish that make use of the texture, sprite and sound data stored in
an
IWAD from DOOM, These small ones on thier own dont contain all the data for badmood to do
it's stuff, for that you need the DOOM.WAD from the game...

Please bear in mind that it is illegal (not to mention almost impossible) to copy this WAD,
but if you get together with a friend with a PC and DOOM and regester your own copy you can
copy the WAD from thier machine to you falcon using a program called GHOST link.

This can be found at

http://www.geocities.com/siliconvalley/lab/8261/index.htm

in the downloads section. There is also an UNZIPPER there too that you may need.
If you need anymore help then i can be contacted at

inorton_badrul@hotmail.com

Toad is still around but by visiting their website
(http://www.toad.net/) it seems that they are not dealing with atari
software. I just recently asked them for some software and they were
able to help me with what they had in stock. If they will order what
you want is a different story. Their FTP site still carries some
software but I am afraid it is not really up to date. I have found
that if you want to buy some software for the atari in the US or
Canada Systems for Tomorrow (http://www.SystemsforTomorrow.com) is the
best alternative.

From: John Kolak <jkolak@jps.net>
Message-ID: <352999FF.6A5B748C@jps.net>
Source record: 103728

The best way to hook up a Multisync, assuming it's compatible with all Atari frequencies, is to get one of the commercial swithboxes. These allow the monitor to support all the ST video resolutions via a switch to tell the computer whether you are going to run mono or color. They also have an audio jack to attach speakers.

Similarly, you need a commercial SCSI host adaptor to connect a SCSI device to the Mega STE.

Following for sale:

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before shipping.

1040STf's-1meg-used/tested.....$50ea. $60 with Atari Mouse or Marconi/Marcus 3 button track ball.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable, used/tested...$75ea.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all items used/tested.......$120

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived PC.
Two units available. 7-Pin video cable.
.
A/B Video Switch Box. Includes 2 Video cables-15 pin SVGA type.
New- for use on a TT with video card-$15

Monitor Master-$10

LYNX STUFF:

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$20

Comlynx Multiplayer cable-new-$5
AC Adapter-120V 60Hz-$10

Software: all games are in the box with manuals
EZ Test Writer-$5
DragonScape-adventure game-$5
Metro Cross-Epyx-scrolling skateboard game-$5
Data Diet-Disk compression program-$5
StarGlider-Firebird-3D combat-air to air/air to ground sim-$5
Final Assault-EPYX-mountain climbing adventure-$5
Transputor-cool 3D marble action game-$5
LED Storm-Road race with lazers-$5
Crash Garrett-1938 adventure game in FRENCH-$5
Karateka-Broderbund-realistic karate fighting-$5
Championship Wrestling-Epyx-Wrestling Mania for the ST-$5
Phantasm-space shoot-em up-$5
Project Neptune-Epyx-James Bond type adventure-$5

Renegade-Taito-street fighting-cool game-$5
Prime Time-make your own TV shows-$5
Battleship-EPYX-boardgame for the ST-all aboard!-$5

That's All For Now.....
Buyer pays Shipping.

Why do not have installed a electronic regulated fan?
It's relay simple..

>1. Do I have to get SCSI, and if so, does this negate the drastic
>drop in price of the last couple of years?

SCSI is much faster than your old RLL or MFM Harddisk.
If you don't have an DMA to SCSI Hostadaptor, it cost's a bit more.
Take a LINK hostadaptor any a brand new SCSI drive from 200Mb up to 4Gig or more
Use HDDriver7 as device driver..

>2. How much might I be expected to have to pay? I don't need a
>lot of space; for my Atari system, 200-300 MB would be plenty (?).

I don't know how much in $
But you have a chance for a lot of SCSI devices..
From witch dealer is equal..

>3. Where can I buy something in Toronto? Is that Compusomething

Sorry about question 3,4,5 i'm not from Toronto :-)
Nice Town? :-) Much far from here.. ;-)

Take a look at the Quick FAQ. This question is asked and answered at least
twice a week.

Either your closest Atari dealer will probably have one, or you can get a PC
serial mouse and the appropriate AUTO folder driver.

Cheers,
Nick

Hi everyone,

(Yes Charly, you dragged me into it and you're the one who will get all hell if this turns out into a mess...) (VBG>

So far I got StinG (version 1.15) going, it Pings and is ready for the final configuration. CAB 1.5 was running already, so there should be no problem on that side. I'm in the process of hooking up at an ISP, maybe end of this week this will be rolling too.

Next: I'm gonna pick up Newsie and get it ready installed, since I need that for my E-mail and Newsgroups. I prefer to be all set and ready whenever I get my account, so I still have some time left to gather the missing pieces.

BTW (this is to Peter R.): setting up StinG literally overloaded me with docs and FAQs, so at first I had all the STX modules still in the wrong folder (\STING\MODULES\) and the Dialer refused to get going, but I sorted out that part and now it seems to be fine...

FWIW, it would be a very poor bet to assume the command-line switches
to cjpeg/djpeg won't change in future versions.

I don't know much about Atari programming, so I won't venture a guess
about the best way to present the IJG library in the Atari environment.
But you should at least assume that there may be new switches.

Neil,

> My TT's clock battery finally went after
> five years of use. What kind of battery do
> I need and where inside the TT can it be
> found?

There were two different types of clock batteries used in the TT030. The early TT030 systems used a square shaped 6v clock battery (located towards the front of the hard drive bay); later models used a 3.6v rectangular shaped battery (located at the rear of the hard drive bay). To easily reach the battery, if its the newer type, you should separate the two halves of the TT's case so you can reach the battery, which is velcroed to the rear of the case, and the plug at the end of the battery connecting wire, which connects at the right side of the mother board.

Once you determine which battery you have, you can probably locate one at a local computer dealer. If you have trouble locating one, drop me an Email and I'll give you a price for one with shipping.

Sheldon (Computer STudio - Asheville, NC)

They can be gotten at Radio Shack, although most stores do not carry
them in stock. If you tell them the number, they can order it for you for
about $10 US, and it will be shipped to you UOS within a week.

>
><< Neil >>
>
In fact you don't need some special kind of battery ... the easiest
way to replace that is one simple way:
Buy two alcaline 1.5 volts AA batteries (you surely have that at home
...) put them togheter to obtain 3 volts, let's connect them to the
old wire and connector cut from the old battery ... that's all and it
will work for years ... I have done it for my TT and for two others
... mine about two years ago ... works perfectly ...

If you don't like this kind of replacement you can find a replacement
battery almost everywhere ... I don't know the references bute there
will be a lot of answers to your question onto the CSAST ...

The battery is located at the right rear side of your TT ... just
beyond the ST RAM card and velcro attached to the TT back panel ... if
you do the first solution, you can even recover the velcro adhesive :)

Just be carefull to not reverse the polarities ...

Hope it helps ...

Hi all,

Does anybody know of a good freeware/shareware MIDI sequencer that
will run on the Hades? I have tried using Sweet 16, and although it
seems to be a very capable package, I simply don't get on with it.

Thanks.

Ben Hills.

t> FWIW, it would be a very poor bet to assume the command-line switches
t> to cjpeg/djpeg won't change in future versions.

To my knowledge, they haven't changed yet, at least recently. And even if
they did, it would simply mean the shell would have to be updated, which
would be no different than if the code was built into the shell.

t> I don't know much about Atari programming, so I won't venture a guess
t> about the best way to present the IJG library in the Atari
t> environment. But you should at least assume that there may be new
t> switches.

Ah, but new swtiches wouldn't make the shell unusable. It would just mean
that it wouldn't support all available options. And again, at worst the
shell would have to be updated, the same as if the code was built-in.

Again, a 2.5" drive fits perfectly well in a bog standard STE, provided
you have an internal IDE interface.

Absolutely correct, any multisync that handles the appropriate scan rates
should be able display all 3 ST resolutions.

But, well, between the NEC and the Amiga one, the NEC is the only one ;-)

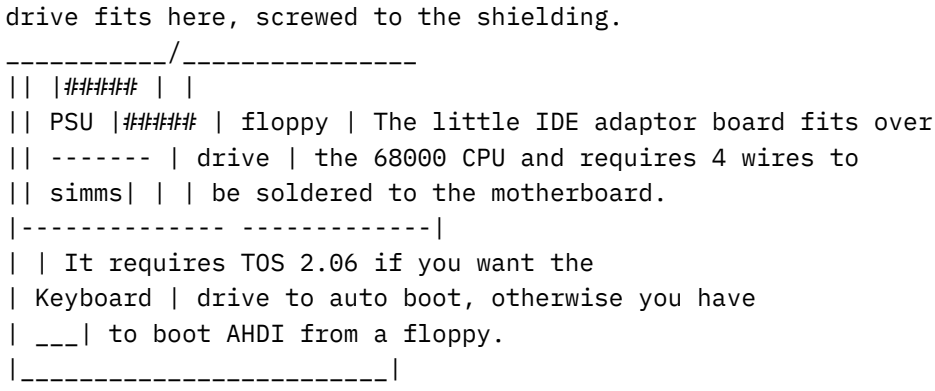
> possibly fit -- and definitely not with all the RF shielding in place.
> So.... where does it go? You've got my curiosity up. ;-)
>

Well, I happen to have one of these TUS IDEal interfaces, and the
internal 2.5" drive fits very snugly inside the STE. These are the tiny
drives that you find in PC laptops or Falcons, so they are really small.
I'll try a little bit of ascii-art to show you how it fits:



drive fits here, screwed to the shielding.
|| |###### | |
|| PSU |###### | floppy | The little IDE adaptor board fits over
|| ------- | drive | the 68000 CPU and requires 4 wires to
|| simms| | | be soldered to the motherboard.
| | It requires TOS 2.06 if you want the
| Keyboard | drive to auto boot, otherwise you have
| ___| to boot AHDI from a floppy.

I'm quite happy with the setup, as it allows me to lug around my STE
without having to carry an external drive. I can just plug it in a TV
whereever I go.

445. FDI and Software

Newsgroup: comp.sys.atari.st
Date: 1998-04-06 00:00:00 UTC
From: claytone@aa.net
Message-ID: <891855573.127986@slave1.aa.net>
Source record: 103772

Hello Falconites,

When using my Steinberg/Soundpool FDI on my Falcon, should I be using an AUTO folder program called FDI_INIT.PRG ? My FDI came with a couple of floppies of stuff from Steinberg that included this program. I just recently reread a file that said I should have that program in my AUTO folder, but I have NOT been using it. A possible explanation... I'm using Emagic's LOGIC AUDIO, not Steinberg's CUBASE AUDIO - which I think this AUTO program was designed for. It seems to work fine without it, but I was wondering if it would help things to run even better, or would I just be wasting space with a program that LOGIC AUDIO might not even "see". Also, I reread an ad I got a while back that talked about the PSI "Pocket-S/pdif-Interface" from the BlowUp people in Germany. (Are they still around?) It also mentioned having software that set up an "error free XBIOS" among other nifty things.

Anyone have some experience on the topic they'd like to share?

Thanks,

Clayton Murray

Hello Atarians,

Are there any programs for the Falcon that eliminate hiss, snaps, crackles, and pops (no insult intended to the Rice Krispies people) that are usually found in cassettes and albums? I know of one such program on the Mac platform that I think was called DINR, but I've never heard of a similar program for the Falcon. It would be nice to be able to clean up some of my "old" recordings.

Thanks,

Clayton Murray

Hallo Barry

I've an Mega ste 4 with tos 2.05 and on my PC I installed TosBox to
emulate my atari and allow me to make file transfers. To use tosbox you
have to copy your Tos to your PC by making a Tos image. After doing this
I have my PC running like my Atari, but with a french keyboard, which is
the keyboard of my atari. On my PC I use a french/swiss keyboard with
characters like ï¿½ï¿½ instead of M on the Atari. I tried to reconfiguer my
PC by unsing the possibility to configuer TosBox but I still had problems
configuring shifted keys and alt key so I thought it would be easier to
find somebody with an french/swiss keyboard and ask him a Tos copy.

I still have another problem while transfering txt files from the ste to
the PC. The atari txt files with the special french characters ï¿½ï¿½ï¿½ï¿½ï¿½ etc.
are replaced with other characters on the PC.
Perhaps you have an idea for this problem?

Thanks for your interest

Bye g.b.

> ... mine about two years ago ... works perfectly ...

I also replaced the original 3.6V battery with a 3V lithium one, but it
did not work: The NVRAM kept its contents, but the clock stood still when
the computer was turned off.
Now I put two packages either with four 1.5V mignon cells (=6V) in the two
TTs I use, and NOW it really works as it should in both of them.
As I experienced, the clock refuses to tick when the voltage sinks below
2.8 volts (in computer off mode).

Greetings,
Carsten

It's 'velcroed' to the back panel just above the SCSI port. You just
need to undo the HD bay.

Others will tell you the part no. of the genuine article but the
batteries are quite expensive. When mine goes I intend to replace it
with a clip holding 2 AA (or AAA) size Duracells.

whew! back off Atari*Dave! :)
Derryck _quite rightly_ assumes IMHO that if you have upgraded to a
Falcon, that you
may no longer have your ST and SLM. MagicSLM is for printing to an SLM
attached to
an ST *from another machine*! You do not need it if you have an ST and a
SLM.
Maybe not a Falcon or TT, but does a Milan tempt you?! ;-)

452. Need New Hard Drive!!

Newsgroup: comp.sys.atari.st
Date: 1998-04-06 00:00:00 UTC
From: CFL <jmh@interlog.com>
Message-ID: <Pine.BSI.3.95.980406084223.2999A-100000@shell1.interlog.com>
Source record: 103779

I am badly in need of a new (?) hard drive for my 4160 STe.
My current is a 127 MB Quantum in a shoebox with a fan that
sounds like a vacuum cleaner.

There are terrible write error problems which are exacerbated by
any heat and/or humidity.

Questions:

1. Do I have to get SCSI, and if so, does this negate the drastic
drop in price of the last couple of years?

2. How much might I be expected to have to pay? I don't need a
lot of space; for my Atari system, 200-300 MB would be plenty (?).

3. Where can I buy something in Toronto? Is that Compusomething
place at Sheppard & McCowan still there? Is there anything in the
west end??

4. Could a non-Atari dealer do the trick for me?

5. Anybody in Toronto know where I could _borrow_ a hard drive to
try, so I can make sure that it's not my computer? I'd hate to buy
a new HD only to find the problem still with me.

Thanks for reading. *Please* respond ASAP if you think that you
can help in any way.

It's okay to answer in this forum, but email responses to

If you get SCSI, then you need a host adapter. If you get IDE, then you need an internal board available in the UK. Otherwise it's ACSI (Atari's standard).

What kind of drive is that Quantum ? If it plugs in straight into the ST, then it's probably already a SCSI and the shoebox contains also an adaptor board.

In that case, you can probably just replace the drive mechanism with another SCSI.

SCSI is still more expensive than IDE, but it's generally better.

>
> 2. How much might I be expected to have to pay? I don't need a
> lot of space; for my Atari system, 200-300 MB would be plenty (?).
>

Unfortunately, 200 or 300 Mb drives are pretty scarce nowadays. You'll be looking for at least 1Gb on the new market. Maybe you can find something on the 2nd hand market.

For price examples, look at the Mac magazines for SCSI drives.

> 3. Where can I buy something in Toronto? Is that Compusomething
> place at Sheppard & McCowan still there? Is there anything in the
> west end??
>

Can't help, but any computer store sells SCSI drives of some sort.

One thing to check though is that you can disable parity on the drive. Some old SCSI adapters will not handle parity.

> 4. Could a non-Atari dealer do the trick for me?
>

Absolutely. Just don't tell him it's for an Atari, or he'll probably
start laughing at you... (I know what it's like, they are clueless).

> 5. Anybody in Toronto know where I could _borrow_ a hard drive to
> try, so I can make sure that it's not my computer? I'd hate to buy

>

What problem, the "vacuum cleaner" noise ? That's more likely to be the
fan in the HD shoebox than the drive itself. If the drive is really
making that much noise, it's time to backup your data.

Hmm, someone's got out of bed on the wrong side! :-)))

Believe it or not, there are people around who have changed platforms yet
still have an ST and SLM laser and want to be able to still print on it from
the "other" machine, I've seen a few questions about this very point in this
NG over the past year or so.

There has been a certain amount of debate about the type of battery required (see postings about February). My own TT needs a 6v battery to keep good time but others say that a 3.6v battery should do. There has been a suggestion that it depends on the revision of the TT.

Try taking off the hard drive cover to the right of the case (there is one screw underneath with an ordinary slotted head) and look around. The battery voltage should be marked on the case.

You want a Lithium Backup Battery of the appropriate voltage and these are probably available in any computer or electronic store. Maplins in the UK has a 3.6 v battery part number AS46A and 6v battery part number AS44X.

I used to use a program called Barrel which can be found at
atari.archive in the Utilities directory. It's an older program
so one of these newer ones might work better, but it's worth a
try as a last resort. I seem to recall it worked on my Falcon
as well, although I had no need for it once I installed NVDI.

What do you need ist the right cable adaptor..

VGA Atari
```
-----------------------------------------------------
1 = Red------------------- 7
2 = Green----------------- 6
3 = Blue------------------ 10
4 = GND------------------- 13
5 = GND ------------------ 13
6 = GND ------------------ 13
7 = GND ------------------ 13
8 = GND ------------------ 13
9 = nc open
10 = GND ------------------ 13
11 = GND ------------------ 13
12 = nc open
13 = Hor.Sync.------------- 9
14 = Ver. Sync.------------ 12
15 = nc open
```

Atari:
```
-----------------------------------------------------
1 = Audio-Output
2 = Composite-Sync
3 = GPO
4 = Monochrom Sensor
5 = Audio-Input
6 = Green
7 = Red
8 = + 12VDC
9 = Hor. Sync.
10 = Blue
11 = Monochrom-Signal
12 = Vert. Sync.
13 = GND
```

>And how can I connect a MO-Drive (via SCSI) to my Mega STE 4 ?

External?
You need a DMA->SCSI adaptor like LINK 96..

Regards, Robert

> the wrong kinds of WADs? What do I need to do to get these to run?

To be able to get Bad Mood running you need a original IWAD from the Doom distribution. The smallest one is about 4MB big and it's from the shareware version of Doom. Then you have got one of those you can then run PWADs which are smaller as they don't contain any textures or sound.

You should be able to run the BM_WADD.LZH found on the BM page as it should be "complete". It's not very pretty (the textures are rather bad) but it works.

The same goes for the other Doom's as well.

Al this should be in the BM FAQ.

Hi Hallvard,

I just got an email back from Roger at Line Audio Designs answering a few questions I had about my FAD and the "Line Audio FDI/ SPDIF upgrade kit". His address is:

roger@lineaudio.se.

Also, his company now has their own web page:
http://www.lineaudio.se.

I went there (I think), but got something like Data Phone company. If there were links to Line Audio, I couldn't find them, but then my Swedish isn't too good. ;-)

Good luck,

There is another program, called MAKEFAST, written by Thomas Much.
(-> http://www.uni-karlsruhe.de/~Thomas.Much/OGEM/).

This program (it's quite a FAT file, but nice) also allows
changing the "minimum memory allocation" bit supported by
MagiC 5.20 and above.

Indeed, it runs on every Mac compatible computer. On a G3 it runs much
faster than on any 68k Mac. You should also buy NVDI, so add the costs
for MagicMac _AND_ NVDI-Mac.
You might consider the fact that I am one of the Authors of
MagiC(Mac/PC),
so my posting might not be honest.

Message-ID: <MPG.f941965426afb869896dc@gazette.stortek.com>
Source record: 103650

I'd like to know if SpeedoGDOS is commercial or if there would be a way of getting a copy off the net.

It seems that it was bundled with a lot of Falcons, so does this mean that it has the same status as Xcontrol or MultiTOS.

I don't have a copy right now, and many programs require Speedo to run correctly. I have copies of old GDOS and FONTGDOS, but they crash with some programs (like qed) or give a bad display (WENSuite) on my Falcon.

Nicholas Bales, <bales@hol.REMOVE.THIS.fr> a ecrit :
>>
>>I'd like to know if SpeedoGDOS is commercial or if there would be a way
>>of getting a copy off the net.

Commercial... Un peu moins de 500 F chez la terre du milieu pour la
v. 5.
Maintenant, les Falcon etaient livres avec une version 4 normalement,
donc si tu as un moyen de prouver que tu as un Falcon, peut-etre peux-tu avoir
un prix de mise a jour simplement ?

(Je reponds en francais puisque le message viens de France...)

Speedo is commercial, and my answer is mainly in french as the
question comes from France.

> Large file handling!
> Any suggestions? Mac or Atari..
> Regards, Robert

well I have a program called CVTranslator, (stands for Carlos Varela Translator, the name of the Toronto programmer)which is slow, but upgradable. Upgradable in the sense that you can click on the english or german word it doesn't translate, and a dialog comes up that allows you to put your translation in(from memory or dictionary, or the ST-Guide german-english *.hyp file) and it will save it in a personal dictionary. You can also edit the dictionaries in a text editor. So it has that advantage over RufTrade2, it gets better with time (unless you can improve the ruftrade dictionary?)
The disadvantage which it shares with all translators is that the translation is literal, word for word; not contextual.
hope this helps.

Another advantage of CV Tran, if I remember correctly, is that several dictionaries exist for it, allowing for translation to and from several different languages. In other words, it is not limited to German->English but can also do English->German and a few other languages like French and Spanish.

It is possible that it is the computer that is causing this. Check the power supply and give the memory the 'freeze test' (ethylene glycol in a spray can). If the computer starts bombing out or things get worse, this should pinpoint the culprit.

I guess easy is a relative term. To me it's pretty easy, even though it does have to be done manually. If your editor saves macros, that would make it easier still.

r> Seems silly somehow to keep features a secret...

Not when the feature all too often becomes a problem.

If you don't think it should be a secret, why not just put it in the docs?

493. Final Chance: Atari Network Cards

Newsgroup: comp.sys.atari.st
Date: 1998-04-07 00:00:00 UTC
From: Curt Vendel <curt.vendel.2@csfb.com>
Message-ID: <352A6FEB.8FAC36C7@csfb.com>
Source record: 103669
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Hi everyone,

Well supplies are almost exhausted, I only have a small handful of Atari/Riebl Ethernet cards remaing with Atari ANS network drivers, I have 1, possibly 2 Atari Mega ST network cards left: $150 each

I have 4 Atari/Riebl Mega STe/TT030 VME bus ethernet cards left: $150 each

I have 6 Atari DMA MetaDOS ASCI network cards with MetaDOS drivers, these need SF354/SF314 type power supplies, do not have cases and are more suited towards hardware hackers who want to play around with these: $50 each

I Have 1 left Image Systems Atari Mega ST video card with amazing color and resolution capabilites with all drivers: $350

Thats about it, all other supplies are exhausted, sorry guys this is you last chance at these, I am taking email reserves, send me an email and I will reserve a card for you for 2 weeks until payment is received.

Curt

494. Atari Transputer Farm Cards

Newsgroup: comp.sys.atari.st
Date: 1998-04-07 00:00:00 UTC

Hi everyone,

For those who have asked me on several occassions, yes I have located 2 and only 2 Atari Transputer INMOS multi-CPU Farm Cards, these cards are $75 each. You must email me and reserve your order, I will hold for 2 weeks, if no payment is received by then I will sell them to the next in line.

Curt

I think it is PD, it is definitely not commercial. I will try and
find out it's exact status and if I can I will put it on my website
so anyone can download it.

Rich.

yes. I made an order with them about two weeks ago. nothing yet.
When I ordered I left many messages on their voice mail, with no reply.
but when I sent e-mail, I was answered in two hours!
have you tried e-mail?

498. --> MEGA & UFOST Disczine <--

Newsgroup: comp.sys.atari.st
Date: 1998-04-07 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6ge68q$cv9$2@heliodor.xara.net>
Source record: 103674

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,

DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional......

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

From Chris Swinson (MEGA DISCZINE)

http://www.users.globalnet.co.uk/~mega01/

499. FS: 520 ST items

Newsgroup: comp.sys.atari.st
Date: 1998-04-07 00:00:00 UTC
From: crisd@foster.com
Message-ID: <6ge810$a98$1@nnrp1.dejanews.com>
Source record: 103675

I have the following items for sale:

HARDWARE

 ATARI 520 ST w/ User&#65533;s Manual (S/N A1 1043222)
 SC 1224 Color Monitor Ver. 2 (made in Japan) w/ User&#65533;s Manual (S/N MI581012313)
 Power Supply DSP-1501 DVE Part No. C070099
 All cables needed for above

All items in VERY GOOD working condition. Take everything for $60.00 or make an offer for any item you want.

SOFTWARE

 HiSoft BASIC Professional by MichTron with Manual and box
 GFA Draft Plus w/ Manual
 ATARI ST 1st WORD w/ Manual
 Tom Hudson&#65533;s CAD-3D by ANTIC Software w/ Reference Manual
 DBMaster One w/ Manual
 ATARI ST BASIC w/ Sourcebook and Tutorial
 MEAN 18 GOLF from ACCOLADE w/ instruction sheet

Everything for $ 20.00

BOOKS

 Presenting the ATARI ST.  1985, L. English & J. Walkowiak. ABACUS Software; 179 pp.  ATARI ST BASIC To C.  1986, Olaf Hartwig; 231 pp.  ATARI ST GRAPHICS AND SOUND.  1986, J. Walkowiak; 255 pp.  ATARI ST GRAPHICS AND SOUND PROGRAMMING.  1986, Henry Simpson, 239 pp.  COMPUTE!&#65533;s ST PROGRAMMERS&#65533; GUIDE.  1986, COMPUTE! Books, 356 pp.  GFA BASIC (298 pages); GFA BASIC BOOK (308 pages); GFA BASIC Training Reboot Camp (260 pages); GFA VECTOR

All for $ 20.00

If you&#65533;re interested in any or all of these items, please contact me at both crisd@foster.com AND dfc@serv.net

506. Looking for a Program

Newsgroup: comp.sys.atari.st
Date: 1998-04-07 00:00:00 UTC
From: eonic man <eonicman@erols.com>
Message-ID: <352ACABB.B761E6F7@erols.com>
Source record: 103682

I'm looking for a program for the Falcon that would record screen as a movie (AVI, Quicktime, Animated GIF, or whatever). Then allow an audio track to be placed over it. This would be great for creating VERY comprehensible Installer Programs that could interact with ST-Guide, GEM-Script and Aniplay. An example would be creating an Atari OS installer that presents small help movies when the user selects "Help" for a function in MiNT, oAESis, GNU-C, or Thing, then presents a dialogue box so that the user can make the necessary change. This all could be on a CD. Would this be hard since we already have A/V and Olga protocals. Perhaps it would just be a matter of adding animated GIF support to ST-Guide with the ability to play a syncronized audio track as well. The image can have play back buttons like Aniplay. This way, it could be played back on any Atari system with MiNT audio device installed or SAM.

I have to side with John. My experiences with NEWSie are very good. The program is not bug free, few are in this day and age, but it works here, very reliably.

I've tried the others and keep coming back to NEWSie. Just another person's experiences.

Does it do entire partitions at once? I got GD_FLAG, which is a nice
program, but it only does one file at a time. I've not found anything even
remotely as powerful as MaxiFile for setting flags of all types, but
unfortunately, it's a bit flakey in MagiC.

well, there's MagiCMac, which is still being supported by ASH, as a
matter of fact they've recently updated it so it runs under System 8.
And there's also NoSTalgia, which is freeware - it requires a TOS Image
file to run it.

>
>And if Atari emuilators are still around - where does one go to find
>them - 'Systems for tomorrow' ???

Systems Solutions in the UK would probably be your best bet to get
MagicMac. Also try Digital Arts Canada (formerly Computer Direct),
Chris might still have copies left.

BTW, a few days ago my brother showed me a Powerbook G3 running
SoftWindows 95, and for a laugh we installed TOSBox 1.2 to run under
SoftWindows. Didn't break a sweat :) Next we'll try running a Spectrum
emulator under TOSBox, under SoftWindows, on the G3 and see what
happens (bigger :))

Yes I priced the 1meg machine higher because it is the STe (enhanced you know the sterio out jacks and increased color) verses a standard ST for the Mega.

To: jmh@interlog.com

Posted on TAF ONLINE and COMP.SYS.ATARI.ST
From : Mike Harrison
Subj : NEED HARD DRIVE!!

MH> I am badly in need of a new (?) hard drive for my 4160 STe.
MH> My current is a 127 MB Quantum in a shoebox with a fan that
MH> sounds like a vacuum cleaner.

I have the same problem with the Quantum Lightning 730LPS on the BBS.

MH> There are terrible write error problems which are exacerbated
MH> by any heat and/or humidity.

Yea... I've had a rash of that lately as well. Cross-Linked
Sectors has been my latest bugaboo. :-(

MH> 1. Do I have to get SCSI, and if so, does this negate the
MH> drastic drop in price of the last couple of years?

Yepper. SCSI is what you must get. IDE doesn't work with what
you have. All it sounds like you need is a mechanism to replace
the bad mechanism in the shoebox. You must open up the shoebox
and acertain that it is indeed a SCSI drive. It might be a MFM
or RLL mechanism. If it has a 50 pin connector on it, it's SCSI.

MH> 2. How much might I be expected to have to pay? I don't
MH> need a lot of space; for my Atari system, 200-300 MB
MH> would be plenty (?).

I doubt that you can find one that small anymore, but if you do
it shouldn't cost more than $50.00 A guy I know bought a used
100 Meg SCSI mechanism from Compumemories on Bloor West for $10.
They are normally in the 1-Gig size today and run around $300.
A Quantum 3.5 is presently going for $60 at M.I. Computers.

MH> 3. Where can I buy something in Toronto? Is that Compusomething
MH> place at Sheppard & McCowan still there? Is there anything
MH> in the west end??

Get ahold of Toronto Computes or the other Free rag and let your
fingers do the walking. SCSI drive are available everywhere. I
have heard that M.I. Computers around Runnymead and Dundas (somewhere)
has some really great deals. If I ever get the time, I'll be
dropping in to see what he has. But pretty well anyplace has
SCSI drives. OTA Computers, Compumemories, and that place on
Sheppard Ave. East that used to be an Atari dealer, CompuPlace.

MH> 4. Could a non-Atari dealer do the trick for me?

(see above) .... yes!

MH> 5. Anybody know where I could _borrow_ a hard drive to
MH> try, so I can make sure that it's not my computer?
MH> I'd hate to buy a new HD only to find the problem
MH> still with me.

It isn't your computer. Trust me. Bring it to a TAF meeting
and we'll prove it.

MH> *Please* respond ASAP if you think that you can help in any way.

All you had to do was ask and a response on TAF ONLINE and e-mail
will be forthcomming. I don't know what you'll get off of COMP.
SYS.ATARI.ST though. The most important thing is.... the type of
mechanism in the shoebox. If it has two connectors (a 32 pin and
a 20 pin - not counting the 4 pin power connector) then you have a
MFM or RLL mechanism and not a true SCSI, If it has a 50 pin
connector, then it is indeed a SCSI mechanism and any computer
shop convenient to you can swap out the bad drive and install a
new one.

It's okay to answer in this forum, but email responses to
<jmh@interlog.com> are preferred.

Your welcome.

Another thing mentioned by the fellow in France is that the "grinding"
sound might be your fan, but I have an olde Seagate and the Quantum on
the BBS just grinding away, depending on the temperature and humidity.
I would tenf to think that with bad sectors, it's the drive.

521. More Registered Shareware

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998040800041401.UAA23039@ladder03.news.aol.com>
Source record: 103541

THE COMPUTER DUNGEON is pleased to announce that we have added
another full version, registered Shareware game to our growing library.

"Realms of Reality" by Robert Megicks continues in the style of RPG gameplay
that made Dungeon Master and Chaos Strikes Back instant classics.

Make up a party of two characters and set out to recover a valuable orb that
has been stolen by the wizard Baldoth.

Great graphics and gameplay, plus the ability to split your party up and
control
each character individually. Runs on an ST or STe with 1meg memory; can be
run from floppy or hard drive.

For more information on "Realms of Reality" and other GREAT Shareware games,
please visit our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm

Thanks for taking the time to read this and we look forward to helping you with
all your Atari needs.

Al Horton
The Computer Dungeon

522. FS: Atari ST System and Software

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: demidem@aol.com
Message-ID: <1998040800375200.UAA29484@ladder03.news.aol.com>
Source record: 103542

Except for a few software items I may have omitted, this is a pretty complete list of what I'm selling:
Atari 1040STe with TOS 2.06 and 2MB RAM (I also have 4 256K simms that I will send along)
Atari SC1435 Color Monitor (14" screen, stereo)
Atari SM147 Monochrome Monitor (also 14" screen)
Video switcher for changing which monitor to use (much better than unplugging/plugging the monitors)
90 MB SCSI Hard drive

These items have boxes and/or manuals>
Productivity Software:
1st Word Plus, Word Writer ST, XBoot, Warp 9, Diamond Edge, Multidesk Deluxe, GramSlam, Image Cat, Abbreviator ST, Stereo Master
DTP: Pagestream, Silhouette, Qwikforms

Games:
Frontline, Borodino, Universal Military Simulator, Annals of Rome, Stellar Crusade, Global Commader, Roadwar 2000, Pirates, Gods, Cadaver, Knightmare, Battlehawks 1942, Disciples of Steel, Chessmaster 2000, Dungeon Master, Their Finest Hour, Risk, Space Crusade, Universal Military Simulator II, Space 1889, Afrika Korps, Computer Third Reich, Air Bucks, Great Napoleonic Battles, Fire-Brigade, War in Middle Earth, Gold of the Americas, Empire, Balance of Power

These are on the hard drive and/or disk, but have no manual:
Degas Elite, BStat (statistical program), EZ Grade, Home Accountant, Soundlab, Starstruck the Astrologer, Tracker ST (database construction), Better dead than alien, laser chess. There are literally dozens (probably about 100-150) disks, some are originals of the software on the HD, some are software items that are not on the HD. There are also about 15 or so demos for the ST, also Pagestream has dozens of fonts and hundreds of images for publishing purposes. These are a few programs like a video and audio collection database. These is also a program called Cardfile which allows you to keep a phone/address book, among other info. Additionally, this includes the Atari international guide to TOS software.
This ST has been optimized with an OS upgrade and graphics accelerators. There are a bunch of utilities on the HD, one for cacheing the file listings which speeds HD access, one for decompressing compressed files, etc.
Looking for offers in the $300+ range (buyer pays shipping), but will consider any reasonable offer. These items are all in very good shape (except the right mouse button is finickyon one of the mice, there two I will send along).

>I was using was 3.5E with Newsie 0.86

Don't blame Everest. I was using the same combination with no (ha ha)
problems (Everest 3.5E and Newsie 0.86)

Let's face it....Newsie is FULL of bugs. I used to spend a lot of
time trying to exit from Newsie...it seems that if you access an
accessory during your time with Newsie, you can't exit until you do a
magic sequence of events...(view log file twice, open URL, chant OM
MANI PADME HUM, curse the dog), and it ALWAYS crashes on me when I
select "Article Overview" when I'm online....but not when I'm offline.

Go figure.

Get yourself NEWSwatch and POPwatch, and an offline reader.

>COPY filename.ext LPT:1

If you are talking about printing it out on a PC, adding the binary
switch would likely be needed for it to print properly, thus:

COPY filename.ext PRN/B

On my PC's Win95 desktop, I have a icon on the desktop attached to a
batch file which simply has:

COPY %1 PRN/B

...which allows me to drag and drop any .PRN file (file "printed" to
disk").

If by any chance the mouse you are using on your Amiga is an
aftermarket version, check for a switch on the bottom. Most are
switchable for Amiga/Atari use. If not, you could wire up your own
adapter, although you should be able to find a mouse relatively cheap.
(In fact, if you are in the US, I have one I will part with).

Most Amiga monitors will work with the Amiga (some 1080's are very
fussy about sync signals), although some may require inversion or
combining of the sync signals (the Philips/Magnavox made 1084 models
should deal with the ST's sync as it is).

Composite is out of the question with a Mega, unless you have a device
such as the Practical Solutions Video Key, which converted the Atari's
RGB to composite. As another person mentioned, Atari's not equipped
with RF modulators also lacked composite output.

The NEC Multisync II would certainly be the best monitor for the ST,
however, as this would allow you access to all three resolutions
(although you would need to add a switch to make it "think" you had an
SM124 attached to let it go into hi-res mode).

Does your assign.sys file point NVDI to the correct folder where your screen drivers live, it sounds like there's some conflict here somewhere. I don't know about Superboot but XBoot has an option for a different assign.sys file for each of its sets.

My assign.sys file's first line is PATH = C:\NVDI.SYS\ and all the NVDI *.FNT, *.SYS and *.NOD drivers live in that folder.

I did have a reason for setting it up this way (rather than the usual GEMSYS folder) but I forget why now. Perhaps it was a wish to keep MagiC's drivers seperate.

>ANy help gratefully received....
None of the other gear you have connected should give you a problem IMO.

I found the same problem with IconJuggler. My workaround was to copy the
last icon twice so that it would show up after, but this does mean that you
have to delete one of them when you add another.

I haven't tried the other utilities you mention tho'.

It's commercial.

>It seems that it was bundled with a lot of Falcons, so does this mean
>that it has the same status as Xcontrol or MultiTOS.
It was only bundled (along with AtariWorks and other progs) with Falcons
fitted with the internal IDE drive as far as I know.

>I don't have a copy right now, and many programs require Speedo to run
>correctly. I have copies of old GDOS and FONTGDOS, but they crash with
>some programs (like qed) or give a bad display (WENSuite) on my Falcon.
I think that you would be better getting NVDI, you'll get a screen display
speeder as well as TTF and Speedo font handling - but will lose Speedo's
PostScript font support unless you also buy the add-on module for NVDI.

Hi!

Is there anyone here using a Jet Media Labs J-33600 Fax modem with STFax?

The SupraFAX modem that I had before worked fine with STFax, MagiC and my
Falcon but this one gets as far as the "answer tone detected" before it
hangs with a "retraining" message. There is no data transfer and I need to
switch the modem off and reboot.

Is there some init string that I should be using with this Rockwell chipset
modem, the manual's about as useful as most (ie not!) :-(

Hi all,

In some of the latest postings I have seen references made to GEMscript.
What I would like to know is. What is GEMscript? I have been looking
at the German homepage, and even when using the translator on Alta Vista
I still don't really know what it's about.

Could anybody point me in the right direction please...

Regards,

Ben Hills.

I usually get a bit irked (is that slang in the UK too?:) with snide
comments too, but re-reading the post, I think the comment may have
MiNT "Strong Headedness", if there is such a term (ahem, any Atarians
not feel this way?:). At any rate, he is free to repost anytime here
and clairify his statement, correct? Personally, I was neutral with
both the post and response.
By the by, is CSAA included in the ban on curse words? If it is, I am
in deep dodo:). Opps, I said a nasty. KELLIS, did you hear that?:)

You might check to see if the window buffering option is enabled in Newsie, and if so, try with it disabled.

Everest (3.5E) works fine here, but on a little different setup. Everest will definetly cause problems under certain configurations with the NOVA video card, so I wouldn't rule out the possibility of a conflict with another application other than Newsie.

I have noticed the delays you mention above, but under STiK, Newsie
works fine. STiNG seems to take a little longer to let Newsie have
control again to do what ever it does that causes the delays. Or, it
may be something that Newsie does not impliment that STiNG requires,
that STiK does not. These guys do live across the world....

The only "bug" in V.86 that I have noticed has something to do with
disk problems, one that John is aware of, I believe.

Maybe your SC3465 timing is set to 76ns. In that case, it will cause
the serial XM4568 to take at least 3*10-6 the normal time for the
gate to open. You surely know that if this happens, and the gate opens
at the wrong time, all data must recycle back through the MOT874A3 six
times before you can exit.

It will probably require making a custom cable. You might also want to
check the scan rates that your monitor will be willing to accept.

Check out the following link for pinouts:

I thought FDI_INIT.PRG puts the audio system in 44k1 mode, for all
purposes.
Some programs that use the audio system do this themselves, but some (a
lot of them) don't, at least not on my falcon system.

I've found 2 bugs with Newsie myself, (and these might not be Newsie's fault).

1) Window redraw: with the toolbar set to the bottom of the text window, I can
scroll in messages/E-mails and it gives a little garbage. Closing
and re-opening the window redraws the screen.
2) Geneva/NeoDesk (latest versions): Newsie works fine for me here, except when I go
to extract a binary file, then it extracts the
file and fails to redraw the screen after I get
the "decode complete" message. I have to use the
task manager to put Newsie to sleep, then re-awaken
it to resume normal operations.

Other than these few problems, I think Newsie is an awesome program! ;-)

]-Maybe your SC3465 timing is set to 76ns. In that case, it will cause

>works when I try to break it.

I appreciate that NEWSIE is in development, and to be fair it seems to
be quite stable OFF-LINE, but the cumulative effect of all the little
bugs is quite frustrating. I forgot to mention another....I ALWAYS
have to press the escape key at the end of each email, otherwise NEWSIE
just hangs there.

Also, I'm unable to save window positions and sizes.

Used in conjunction with POPwatch and NEWSwatch, NEWSIE works quite
well for me as an offline reader, it's just that there are features in
OASIS that I find preferable.

554. Atari Software for Sale (Canada) Some hardware -- Must be sold

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <6gg4s3$mb@freenet-news.carleton.ca>
Source record: 103574

Hi! At the insistance of my Significant Other *grin* I'm unloading a number of excellent Atari programs that I'm no longer using. Most are complete.

Spectre GCR version 3.0 $40.00
Vidi St video Digitizer $30.00
Geneva $30.00
Neodesk 3 $10.00
Wordup 3.0 $5.00
Maxifile $5.00
Imagecat $5.00
Diamond Back 2 $10.00
Warp Nine $5.00
Pagestream 2 $15.00
STOS basic, manual, Compiler, manual, and 3D extension, no manual $15

Many magazine coverdisks, make me an offer...

Many games, $5 each, including: Ultima 3, Monkey Island, Cadaver, Starflight, etc.

I'm prepared to make some deals, folks...

I also have an Atari colour monitor and a monitor master, as well as a nine pin printer. I would sell the monitor for $40, the printer for $20, and the monitor master for $10. make me an offer if you don't like the price, and I'll listen. Buyer pays shipping.

Cheers!

> Hallo Goetz
>
> Just curious. Why does MacSoup post your name as: =?ISO-8859-1?QG...etc?
> I've seen this many times here.

It does so because his fullname contains an "Umlaut", i.e. an
8-bit-character, which is not allowed in mail or news /headers/. That's
why it has to be converted into 7bit-ASCII using the encoding you
encountered. Obviously, your newsreader isn't able to decode that
correctly, because otherwise you would just read "Gï¿½tz Hoffart", and
nothing else (provided your newsreader does at least know how to display
"text/plain; charset=iso-8859-1" messages correctly, because otherwise
you can't even read his name in this message without problems ...)

Ciao

Seems to work nicely with Magic 5.11 on my STE. No different to FILEINFO.CPX

> >Use GD_FLAGS97 this works in the magic environment and sets all the
> >flags with a mouse click. If you cannot find

Haven't tried that method as yet. However, it uses the 8+3 name when you
use the file selector to pick the filename.

I'm not sure, but I think there was a program called ALBION that did the
same, or near enough, as FILEINFO and CHNGFLAG. Not sure if that one is
Magic compatible, as I can't read the floppy it is on. ST Format disc 62,
if anyone's interested.

It does work under Magic 5.11 on a 4Mb STE. Can't say about other systems,
but it works here.

562. --> MEGA & UFOST Disczine <--

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6ggla4alv2@heliodor.xara.net>
Source record: 103582

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,

DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional......

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

From Chris Swinson (MEGA DISCZINE)

Scary isn't it... I experience the same thing running under Geneva and NeoDesk. But this never occured until munpack.ttp was bundled with the program. For non-MIME encodings, uud.ttp always worked fine under these circumstances (no problems after decoding in NEWSie). (But when not called from within NEWSie, munpack.ttp works fine of course.)

Perhaps both of us have munpack installed incorrectly? The docs for munpack mentions something about a tmpdir environmental variable, but I haven't updated Geneva's gem.cnf file. I'm not even sure of the variable's syntax, or if it's required in the first place. Maybe it's a factor when it comes to NEWSie and Geneva? Instead of decoding in NEWSie, I just 'save as' and use munpack on the desktop (through a NeoDesk NPI to redirect output).

Related, I've always wondered why NEWSie's log reported 'no AV Server found' even when 'Use NeoDesk for AV Server' was selected. Ends up I didn't have my gem.cnf configured correctly, and had to add 'setenv AVSERVER=NEODESK'. But I've just recently done this, so I don't know if NEWSie would perform some tasks differently now.

I agree with those who report _no_ problem with this combination.
Newsie does sometimes freeze after closing an overview window (mouse
arrow moves but no response from menu or newsgroup box). The
handling of the numbers in the newgroup box is a bit wonkey as
reported before but on the whole Newsie works well.

Occasionally an error message appears saying 'AES call 104 error'
(or words to that effect).

Newsie has the advantage that mail and newsgroups can be handled by
the same program and that _is_ convenient. Roll on the next version
- not necessarily more twee but rather more robust.

I noticed that. I wonder, does it really make any difference? I can do an entire partition at a time with MaxiFile, but it's not VFAT compatible, so I wonder if it's really setting the fastload bits on files with long filenames. Anyone know?

568. APEXJPG.TTP & MagiC

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: outrider@anv.net
Message-ID: <2000_outrider@anv.net>
Source record: 103588

I was having trouble with screen glitches with this combo. Turns out it was caused by VT52. I fixed it by renaming to APEXJPG.APP.

That caused it to write on my desktop, leaving a mess, and causing my desktop to scroll after several uses. I fixed that with a binary editor.

One problem I've been unable to fix is loading pics with long filenames. Most of the time it won't load them at all. Others it will load, but oddly, only the first part of the pic displays properly; the rest is a mess.

Since APEXJPG chokes on files with a tilde in the filename, even sending it the 8+3 version of a long filename will not work.

Has anyone gotten around this problem?

Or perhaps there's another program that automatically switches the screen res to at least 16-bit and displays the picture? JPEG220 is a partial solution, but it doesn't like NVDI and my experience is it's not very robust.

I suppose one solution would be to write a Mupfel batch file that renames the pic to a temp file, loads APEXJPG, and then renames it back. Not a real elegant solution, and requires me to swithch from Ease to Magxdesk, but it may be the only way around it.

Any ideas?

The studio module simplifies the task of assigning new sounds to tracks
without using PG commands. If you have several synths, you are only 2
clicks away of testing sounds. You can also set up new sounds before
the song starts by sending Sysex.
The styletrax is a tool to compose music. It is an algorithm far better
than any other I've seen. Highly recommendable.

Hi,

There are hundreds of programs for making music and listening
to music which you can download at
http://www.hitsquad.com/smm/atari/

There is mainly ST software but there's also some for the
Falcon.

The site has software for midi, MOD, audio, recording,
multi-track, MPEG, soft synths, drum machines, guitar tuners,
samplers, patch editors/librarians, mp3 players, sequencers,
algorhythmic composition, and heaps more.

cheers,
jason.

Re: "RSC-file (icons) editing problems", hall@post1.com scribbled the
following on 09 Apr 98 @ 00:42:49:

h> Are there any programs around which does the same job as Iconjuggler,
h> only without the mentioned bug?

I'm not exactly sure what Icon Juggler DOES, but the icon editor that comes
with Ease is very good. I'm not sure you'd want to buy a new desktop just
for the icon editor, but perhaps you could get a cheap used copy.

Maybe, maybe not. If so, then that makes three of us with the same problem so it's not likely a configuration problem. Minor nuisance but hardly a show stopper.

The email hang is something that I have seen, and NEWSie 0.90 has a
special "fix" to delete these messages so they don't have to timeout
everytime. I believe it has something to do with not recognizing the
'.' at the end of the email from some 'non-RFC compliant' mail
programs, but I haven't been able to defintely identify that...

Unless NEWSie gets a "good" response, it doesn't delete the mail, and
therefore, the "bad" ones come back again and again.

576. ICTARI R.I.P. ?

Newsgroup: comp.sys.atari.st
Date: 1998-04-08 00:00:00 UTC
From: augeas@elis.demon.co.uk
Message-ID: <99822651_000034_OASIS_NEWS@elis.demon.co.uk>
Source record: 103596
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

[For those who haven't been following the plot, ICTARI is a disk-zine / user group for Atari programmers.]

Is ICTARI dead ? Not if I can help it, but I'm not sure that I *can* help it. The latest issue is months late due to the slow trickle of contributions.

Want to know why your code doesn't work ? Send it for some constructive criticism. Got a programming problems ? -Ask. Want to share some routines ? -I'd be very gratefull. ICTARI can't continue without the cooperation of others, as the lateness of the new (short) issue shows. I will continue to try an make more back issues available, but surely ICTARI can still be a going concern ? Tell your non-netted friends and user groups, and please send me something worth publishing ! I can't have any enthusiasm unless someone else shows some.

In the meantime, issue 52 is at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

What it does have going for it is Mark Wherry's[1] new iPL scripting language.

Have Fun,
"Augeas"

[1] Mark, my mail to your HotMail account keeps bouncing.

d> can I find a error list or how can I gain access to the CD unit.

There are German Magic docs available from the ASH site, but the cause is
most likely due to the failure of the driver to install properly. There was
certainly an initial problem with Extendos, but it was quickly corrected by
the author with (I think) v2.4b available at the site mentioned by Ken.

d> 3rd. When I boot and the computer starts to load the UIS III program
d> the machine crashes with 4 bombs. (last program in the auto folder) I
d> would hope that it works with UIS do I need a newer version or a
d> patch to make it work?

There are a couple of ways to get UIS to work. Again, the patched version of
UIS is available at the site mentioned by Dave. Secondly, you can put the
following in the #_AUT line of your MAGX.INF file:

#_AUT C:\UIS_III.PRG

Unfortunately this will prevent you using an alternative desktop...

d> If not is there a good replacement for it.

UIS is a very good file selector, but it's lack of development means it's way behind others in its lack of features.

Selectric is a viable alternative (I've switched to it from UIS myself), although it can't survive a resolution change under Magic. Freedom is also very good, though it does have some bugs in v1.15 and is German only in v2 - both could be said to be unfinished, but they are very strong in features. I'll be testing Freedom again soon.

d> 4th. Is it recommended to use another desktop like Neodesk or the
d> like. If so what is a recommended one?

If memory is tight, the desktop in both v4 and v5 is remarkably good. I've never felt the need to change because my circumstances dictate that RAM is more important than rarely used features. The latest Neodesk does work with Magic, though favourite seems to be Thing right now, with Jinnee being one to look out for once it gets translated in progress now).

Ease was another, but tbh no-one liked it, it doesn't support all of Magic's features and it's no longer in development AIUI.

d> Ahhh the last question for now. Just how do I change the icons on the
d> current desktop. It seems that all I have tried doesn't do a thing.
d> Is there and Icon editor for MagiC?

Andreas described the procedure for adding icon files. I use Interface 2 (from Floppyshp in the UK) which is a full-blown resource and icon editor. The only shareware *colour* icon editor is ResourceMaster v2.11 available from Joe Connor's Interactive website (along with Thing, Freedom etc).

PR> actually show 19200 bps as the current setting even though you saved
PR> with 38400 bps ?

Both actually. If I reboot and immediately enter the SERIAL.CPX I see Modem
1 @ 19k2. If I boot the Dialler, then before enabling recheck the CPX it
switches to Modem 2, but still at 19k2. If I Enable and dial without making
any changes to the CPX I get a 19k2 connect instead of my usual 31k2.

PR> If it's latter (what I suspect), then try the following : Disable

It has nothing to do with the audio clock (for 44.1 or 48 you need an external clock source). What it does do is ready the system to look at the DSP port for other clock frequencies.

RM> I just got a Matrix TC 1208 Graphics Card for my TT. It didn't come
RM> with software drivers. Could Someone e-mail me the files to
RM> rmahlert@delphi.com ?

Hi Rob,

just DON'T use these, they're lousy...
I got the very latest update for them, they still create problems with some software (That's Write, Freedom, Jinnee, ST-Guide a.o.). Spend some money on the NVDI for Matrix (available at Behne in Germany) and get the card working 100 percent plus the increase in speed!
The only problem is: to install this NVDI you need to have the latest update of the Matrixdrivers installed first.
If you don't manage to find them, I can send them to U, but I'm in the process of hooking up into the Internet right now, it may take a while before I'm able to do so...

I had to go in and edit the .CFG file in Everest before the window sizes I prefer would "take". I found it useful to have email and news messages open in the full window, rather than having to use the "fuller" button every darn time.

Another little niggle, I've found that with busy newsgroups (notably rec.audio.pro), even when I've set the "Get # of Messages" to 200, and the newsgroup shows under that number, I still have to click on the newsgroup 3 and 4 times before it returns no new messages. Granted, there could be some new arrivals between the time I first download the list, and the time I've finished going through them, and then clicking "All Read", but every time after the first list, Newsie reports that there are 0 messages in the group, when clicking on the name will bring as many as 50 more messages, and then 10, and then 3 and then finally none.

How is the count updated?

Regards,

596. How can I tell TOS version?

Newsgroup: comp.sys.atari.st
Date: 1998-04-09 00:00:00 UTC
From: Greg Malick <tiger@hgea.org>
Message-ID: <352D153A.5D2A@hgea.org>
Source record: 103494

Aloha,
Is there a program that can tell me the TOS version on my ST?
All I can tell from the screen is the years that it was in effect (???)
or copyright or something.
Since most software compatibility references the version number, these
years don't do me much good.

Sincerely,
Greg Malick

>of difference.

No, it didn't make any difference, as I just tried some Geneva/NEWSie
v0.86 decoding tests. After munpack is finished, all of NEWSie's open
windows are closed, but an 'image' of them still exists on the screen.
The MIME message is extracted correctly but NEWSie is now unstable, so
it's more than just a screen garbage problem. But like Pat said, it's not
a 'show stopper' to an otherwise good program.

The docs for munpack state "Compiled with PureC 1.1 for `normal' TOS."
But I'm not sure what 'normal' means in this case.

>I think some of my problems with some program lies in the resolution that
>I'm running in. I've got Nemesis installed in my Falcon, and I'm running
>at 800 x 600 x 256 colors. Seems some apps/progs. just don't like that. ;(

I'm running extended video, too. But how do the programs you mentioned
run under normal TOS (without Geneva)? NEWSie, for instance, runs fine
in that mode after a MIME decode. One program I can't get to run under
Geneva is Focus 3D, but it runs under normal TOS. Setting the execution
flag to tell Geneva to singletask Focus 3D didn't work. But at least this
rules out the resolution factor.

>windows, or 'all'?

I haven't been able to save any changes to window sizes, unless I edit the preference file manually, and then it's hit or miss because I don't know which entry is for which window. Once I ended up with a really LONGGG status window (that one that tells you whether you're connecting). But it seems that you can restore the defaults by simply erasing the window line from the preference file.

I was fooling around with this cause I wanted to get a bigger "Article Overview" window. Never did get it.

One viable option is to use a syquest ez flyer, obtainable from 99(UKP),
you will need the link adaptor too though. The ezflyers are very quiet,
fast (av seek time 13.5ms) and cartridges are only 20 (ukp) for an extra
230mb! BTW syquests, unlike zip drives are bootable

>
>Visit the web page (in sig) then contact the appropriate person :)

Ahhh, more things to get round to doing.....

Yep, good idea. ICTARI managed to get itself advertised in ST
Applications without any help from me at the time. The amount
of traffic that flows from the ICTARI page completelt dwarfs the
amount that flows to it. A *lot* of people reckon that they are
Atari coders, but I see very little evidence in the way of
contributions. I know not everyone's on the net, but I'm sure many
of the people on it could consider themselves "Power-Users" who
might dabble in coding.

All the same, time to hit the ST Zines...

exercises include:

1/ Finger-toning while speed typing
2/ Eyelid-muscle-enhancing while staring at the screen
(programmers, mostly)
and of course:
3/ Fanny-flattening while seated for multi-hour intervals.

>Visit the information page at;
>http://www.earthlink.net/spam

At this address, you'll find the anti-spam
policy statement by earthlink.net, the original
poster's Internet Service Provider. You will
also find additional links to spam-fighter sites
available elsewhere.

>You'll be glad you did!!

It'll give you something to talk about at the next
User Group Meeting.

>Other natural herbal products for health and prevention available at;
>http://www.herbsonline.net

This was the quiz in the posting: the natural
herbal products may be used for either:
a) Health enhancement, or
b) Health prevention.
Your choice!

>This is a very extensive site with an abundance of information.

... and ALL of it is Atari related! (NOT!)

>So give yourself some time to browse the site.
>Make sure to bookmark the homepage.
>It is a tremendous resource and you'll definitely want to go back.
>
>Happy Atari Computing to you.

Newsgroups trimmed. Followups set to pagemaker@earthlink.net
but not abuse@earthlink.net , since the poster is separately
offering an Atari monochrome monitor for sale.

Have a nice day.

613. Falcons w/music SW/HW FS

Newsgroup: comp.sys.atari.st
Date: 1998-04-09 00:00:00 UTC
From: guitarmn@earth.execpc.com
Message-ID: <6gk2gk$b2p@newsops.execpc.com>
Source record: 103511

After many nights of soul-searching sleeplessness I've decided to part with two of my Falcon systems. Both work flawlessly, and I'll guarantee they do or youmay simply ship them back within three days. If you need to mix/match or are interested in the pieces I'll consider offers but the best price will go with a package sale. So, here they are:

Two Atari Falcon 030 computers, each w/14megs of ram, 80meg HD, and all necessary audio mods. One is in a Wizztromics rack (3 sp.)with a zillion ports and PC-compatible external keyboard and is further housed in a 4-space Calzone flight rack, while the other is a standard Falcon (all-in-one unit).

SMP 11 2in/4out MIDI interface w/SMPTE

FA8 Adds 8 analog outs to the Falcon

Cubase Audio Clock Allows Falcon to use 32khz, 44.1kh, 48khz audio files and hear/edit them at proper tempo/pitch

Falcon Digital Interface Adds digital ins/outs to the Falcon

Two Color monitors (15")

External CDRom (4x)

Two external 1 gig scsi hard drives

CDRom (2x) and Syquest 44 drive with one cart housed in external case

14.4 fax/modem

Micro MidiMacman Adds another midi out to the Falcon via the LAN port

Falcon Colorburst hand scanner

All cables/mice/etc. necssary to connect each of these items is available

Now the software:

Cubase Audio Falcon 2.06 16 tracks of simultaneous audio

Two copies of Logic Audio Falcon 2.01; each comes with the LOG3 interface (adds 3 more midi outputs to the Falcon)

CDs:
Crawley Crypt 1, 2
All Things Falcon
Atari Public Domain and Shareware

ICD Pro utilities 6.5.5

HDDriver7.12

Pagestream 2.2

Extendos Pro

Stalker 3

Neodesk/Geneva

Two copies of Warp 9

Publishing Partner

XBoot 3

Screenblaster 2

Atariworks

Diamond Back 3
Diamond Edge 2

Imagecopy 4

Many graphics programs, wordprocessors, etc.
Tons of disks of games/shareware/etc. These will go with one of the systems.

I want these systems to go to someone who cares about a fine tool, who understands exactly how cool these actually are, so if I can help by answering questions via email that's perfectly fine with me. Also, if you buy a system and don't understand something you are free to call me anytime and if I can help I'd love to do so. I know, tech support--wild, huh?!
All items are best offer, and I want to sell ASAP, so you'll have to ride the line between giving a fair $ amount vs. my timeframe for sale (by the end of April). Thanks in advance.

Yes they have, - but from my experience, they only work with the
cad plotter program and plotter files.

At least that is the case with CampusCad/TechnoCad. Can`t remember
how DynaCadd is on this matter.

I`ll try to dig out some disk with CADANS or ARKEY to see if there is
any difference. But I think not.

From: dreibel@idirect.com
Message-ID: <352c2fa3.0@diana.idirect.com>
Source record: 103613

Are you a professional recording engineer or do you like to dabble with recording? Do you use the Cubase package for the Atari ST, or have ever wondered about what is considered one of the best sequencers for MIDI instruments on the market today? Then have we got a meeting for YOU!

On Wednsday, April 15th, the Toronto Atari Federation will be putting on a very special presentation with Ray Williams of Steinberg Canada and Club Cubase! Featured at this meeting will be a demonstration of Cubase Audio 16, the 16-track hard disk recording/sequencer package for the Atari and C-LAB Falcons that puts together a comprehensive recording studio solution in your own home. Ray will also be giving tips and tricks that will help users of Cubase get the most out of their sequencing and arranging, and should also have product for sale as well.

We're honoured that Ray has volunteered his time for this presentation, and we know that this will be a VERY informative meeting for all MIDI and recording enthusiasts. This meeting is definitely not to be missed!

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

617. ATARI REPAIR IN L.A. ??

Newsgroup: comp.sys.atari.st
Date: 1998-04-09 00:00:00 UTC
From: jcpowers@aol.com
Message-ID: <1998040904195801.AAA06367@ladder01.news.aol.com>
Source record: 103614

Does any one still repair the Atari 1040 ST,
In the Los Angeles area?
Any information would be of great help to me.
Thanks.

JAPOWERS@AOL.COM

618. FS: Atari stuff for sale...

Newsgroup: comp.sys.atari.st

After buying quite a few computers i've accumulated duplicates of
these items so their up for sale. I need the space!!! They goes
as follows:

Hardware: All with Manuals

* Atari 1040STf (1 Meg)/Broken Keys but still works ..... $ 25
* Atari SM804 w/Outburst.............................. $225
(Needs new drum and toner)

Hardware: No Manuals

* External disk Drive (Needs Power Adapter, Radio Shack) . $ 10

Software: All With Manuals

* Easy Draw .... $ 10
* Degas Elite .... $ 10
* Typesetter St .... $ 10
* Stalker/Telecommunication Software .... $ 20
* G+Plus .... $ 10
* Migraph OCR/Optical Character Recognition Software ..... $ 10
* Mr Boston Official Bartender's Guide .... $ 2
* The Juggler .... $ 5
* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 50
* Hyrid Arts Semte Track w/sync box .... $ 75

Software/No Manuals:

* Hybrid Arts Ludwig Music software .... $ 3

Games: All with Manuals

* F-15 Strike Eagle Flight Simulator .... $ 10
* Elite/A Fantastic Voyage .... $ 10
* Defender Of The Crown/Knight Fight .... $ 10
* Knightmare/Knight Fight .... $ 10
* ShadowLands/Barbarian Fighting .... $ 10
* Barbarian/Fighting .... $ 10
* Lemmings/Maze and Building .... $ 10
* Ultra V Warrior of Destiny/Knights .... $ 10
* Baby Jo/Baby Super Hero .... $ 10
* Drakkhen/Dragons .... $ 10
* The Pawn/Good and Evil Fight .... $ 10
* Dragon Of Flame .... $ 10
* Breach .... $ 10
* Time Bandit .... $ 10

* Quest Glory ..... $ 10
* Romancing The Throne ..... $ 10

Games Disk only:

* Dragon Master ..... $ 5
* Rambo 3 ..... $ 5

Programing Software & Book Combination:

* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 25

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 20

Programing Books:

* Prospero C, Language, AES Bining, Library, VDI Binding . $ 25
* Atari ST Internals/The Authoritative Insider guide ..... $ 10
* Atari ST Graphics & Sound/Mastering Capabilities ..... $ 10
* Peeks & Pokes/Hidden Secrets with in the Atari ..... $ 10
* Atari ST Application Programming ..... $ 10
* Atari ST Gem Programmer Reference ..... $ 10

Software Books with no Disks:

* Mark Williams resource Editor For The Atari ..... $ 3

Willing to work on package prices. Buyer(s) pays postage!! All reasonable offers will be considered!!!

e-mail: smooth1@akula.com

This list along with other stuff is on my web site. Drop by and check it out!!!

Source record: 103616

Robert Schaffner wrote in message ...
>You don't need BigDOS while using MagiC. Read the manuals!!
>That doesn't work well.

Guess what I found out when I RTFM'd? ;) In MagiC I now can use the partitions ... but that's because I upgraded to MagiC 5.13 yesterday. In MagiC 4 it just didn't work ...

>Your HD driver sounds like a update :) (Sorry) :)

I also upgraded to HDDriver v7.0 since yesterday ... and I got the same problem with BigDOS in TOS ... mostly when using JPEGview v2.22 ... when I open a directory it might display the dir's contents as garbage. When i tried to open some archives from a ZIP-disk whilst in TOS I got garbage from almost all files. In MagiC 5 it worked out ok ... But I beleive BigDOS and TOS should work together using HDDriver ... but apparently not.

>>questions ... does germans learn to make english doc's? Where can I get hold
>>of "AUTO-drivers" for serial mice ... I need a helpdesk!!! ;)
>Yeah, that's a problem, allways..
>Regards, Robert

But I have learned a lot of german thanks to my Atari. The message "erfolgreicht beendet" scared the shit out of me the first time I ever encountered it, it sure doesn't sound successful ;)

Regards, K�re

Sure is:). I just tried the tool bar at the bottom of the window, and
I didn't see the problem you describe. On the NOVA, if window
buffers option is enabled, I do have problems with screen redraws, so I
leave that option off. I assumed it only occured with the NOVA as no
one else (could hae missed a post I guess) had mentioned it. Do you
have the window buffer enabled?

Some times MUNPACK leaves trash at the top left corner of the screen.
I have to force a window redraw to clean it up under N_AES, but I
never have to exit Newsie. I installed CLEANSCR.PRG under a function
key, and just hit that to redraw the screen (from Thing). The dialog
boxs always exit when the operation is complete (again using N_AES).
I don't have Geneva anymore to try this out. How does Geneva and NeoDesk
handel TTP apps output? Maybe Newsie is waiting for something that is
never getting back.
>
>]-Maybe your SC3465 timing is set to 76ns. In that case, it will cause

> Wow, what a great "techie" explanation! (is everyone taking notes?) ;-)

I was going to call it the SC1224 chip, but I thought that would be
taking it a little to far:).

If you find someone in the LA area, I'd
sure like to know about it. A music chain
called "Guitar Center" used to sell Atari
Computers and _may_ still offer service
(although it's doubtful). You can probably
find them listed in the Yellow Pages under
Musical Instruments.

Lacking that, Alex Yoh in Oakland (only an
eight-hour drive up Interstate 5) does
superb work in a short time. You can reach
him via my web page at
http://www.tmisnet.com/~strads/hq/sources.html#Dealers

Thanks to all of you out there keeping the Atari alive! My HD broke down a year ago or so on my Falcon 030 and in fact I didn't use it a year before that due to where I worked. I've now started get it running and maybe developing only because of one thing, all of you still active people! I got to comp.sys.atari yesterday, and gee! Did I get happy about seing some activity! On the Web there's also loads of stuff ... I've got more Atari links than anything else in my bookmark list now ;)
Let's work for keeping Atari alive! Even if it still will be the sort of "underground movement" it's been for a while now. Hell, if needed we'll raise money to buy the original Atari group ;) And somehow, I don't know how, we need to get Atari beyond the 680x0-chip, without emulating it on a Mac or PC. I've worked with authorized service on Mac and is now mostly working with the Win 95/NT-platform, and my "original" Falcon from way back is still the computer I appreciate the most, even if I don't have any monitor right now. Heck, the mouse is falling apart on me and I still love using it.
The plans for using Amiga PowerPC cards is one great approach ... but I hope we'll just beat the shit out of the Amiga-scene ;) And with the talent's I've seen still active, we'll do that, no doubt.

Keep it up!
i apologize for getting emotional and all ;)

Best Regards, K�re Hampf

You don't need Big-DOS with MagiC in order to access PC compatible
partitions.

>

No problem on my side. Fitting it was an afternoon job, since you have to
remove the entire STE PCB to solder underneath. The instructions are
pretty clear, it plugs into the CPU socket, over the CPU, and then you
solder 4 wires to the PCB.

The only thing is that it requires TOS 2.06 to autoboot the IDE drive,
With TOS 2.05 or 1.62 you need to boot AHDI from an AUTO folder on
floppy. I'm not sure about compatibility with HD Driver or other drivers.

The whole setup is pretty quiet and looks pretty neat.

> Sounds good. Are you thinking of getting their CPU speeder as well? (68020 @
> 16 or 24MHz)

I recently got my hands on a Falcon, so I won't be investing much more in
the STE-from-Hell. Besides, I presume that the CPU speeder will have to
fit over the original CPU, just like the IDE board, so it will probably
be impossible to fit both.

I know that Sun Stations are tricky on what sector size a SCSI cd rom
have. This can be altered via various settings on some CD-ROM drives.
Could this be the reason for your problems too? A Apple CD-ROM have to be
modifyed to be used on a Sun AFAIK, dunno if it applies to an ST as well.

Regards.

On 8 Apr 1998 20:27:28 , Neil Roughley wrote:

]-Scary isn't it... I experience the same thing running under Geneva and
]-NeoDesk. But this never occured until munpack.ttp was bundled with the
]-program. For non-MIME encodings, uud.ttp always worked fine under these
]-circumstances (no problems after decoding in NEWSie). (But when not
]-called from within NEWSie, munpack.ttp works fine of course.)

Never tried using MUNPACK.TTP or UUD.TTP other than from within Newsie.

]-Perhaps both of us have munpack installed incorrectly? The docs for
]-munpack mentions something about a tmpdir environmental variable, but I
]-haven't updated Geneva's gem.cnf file. I'm not even sure of the
]-variable's syntax, or if it's required in the first place. Maybe it's a
]-factor when it comes to NEWSie and Geneva? Instead of decoding in NEWSie,
]-I just 'save as' and use munpack on the desktop (through a NeoDesk NPI to
]-redirect output).

I'm not too sure about this, either. What gets me is that Newsie works fine
for me under single-TOS, and it worked fine for me under the last version of
Geneva/Neodesk before I updated. BTW, Newsie isn't the only program I had that
quit working correctly under the last Geneva/Neodesk update. I also lost my
MPEG player (2 bombs out now), BNG-Play (can't find its .INF file), QED (can't
use the clipboard or it gives an error), and the SAM ACC of all things! (there
are others too...) ;(

]-Related, I've always wondered why NEWSie's log reported 'no AV Server
]-found' even when 'Use NeoDesk for AV Server' was selected. Ends up I
]-didn't have my gem.cnf configured correctly, and had to add 'setenv
]-AVSERVER=NEODESK'. But I've just recently done this, so I don't know if
]-NEWSie would perform some tasks differently now.

Hmm...not sure. I've currently got the "Use NeoDesk For AV Server" option
turned off. Let me know if it (and your GEM.CNF entry) does make any kind
of difference.

I think some of my problems with some program lies in the resolution that
I'm running in. I've got Nemesis installed in my Falcon, and I'm running
at 800 x 600 x 256 colors. Seems some apps/progs. just don't like that. ;(

Talk at ya later...! ;-)

]-Sure is:). I just tried the tool bar at the bottom of the window, and
]-I didn't see the problem you describe. On the NOVA, if window
]-buffers option is enabled, I do have problems with screen redraws, so I
]-leave that option off. I assumed it only occured with the NOVA as no
]-one else (could hae missed a post I guess) had mentioned it. Do you
]-have the window buffer enabled?

I've had it enabled before, I'll try it without and see if it makes a
difference. Of course, I'm not fortunate enough to have a NOVA...! ;-)

]-Some times MUNPACK leaves trash at the top left corner of the screen.
]-I have to force a window redraw to clean it up under N_AES, but I
]-never have to exit Newsie. I installed CLEANSCR.PRG under a function
]-key, and just hit that to redraw the screen (from Thing). The dialog
]-boxs always exit when the operation is complete (again using N_AES).
]-I don't have Geneva anymore to try this out. How does Geneva and NeoDesk
]-handel TTP apps output? Maybe Newsie is waiting for something that is
]-never getting back.

When MUNPACK extracts MIMES or those darned Apple files, it does give a
brief message on the left hand side of the screen, and then not all of
that message is redrawn, but thats not what I've been talking about. The
garbage is the toolbar being corrupted and not redrawn until I open and
reopen the message or sometimes just by completely scrolling to the top
or bottom of the message using the window strip. I'm not sure about your
Geneva/TTP apps output question, maybe somebody with more knowledge of
Geneva could step in here and help? (Dan Wilga, where are you!) <grin>

]-I was going to call it the SC1224 chip, but I thought that would be
]-taking it a little to far:).

Distribution of TOS is illegal. You need to make a TOS image on a real ST. For LZH files, look for lharc.ttp (for the ST) or lharc.exe (for PC). You can find them on all ST FTP sites, and many PC FTP sites.

If you want to get a real ST, keep on reading this newsgroup, there are several 'for sale' ads every day. There's bound to be one for you.

From: Dennis Bishop <102063.112@CompuServe.COM>
Message-ID: <OJrbig3Y9GA.286@nih2naab.prod2.compuserve.com>
Source record: 103635

Today I took the wwwboot.zip file and moved it over to my Falcon,
I unziped it, moved it to my H:\ drive, and renamed the folder to
'NET'.

I've looked for and tryed to find any cfg files to edit, so that they
would all match the pathways. I've also placed in my auto folder
the sting.prginf, files. I already had my falcon set up with HS7, so I
didn't need to change that. I also work off Neodesk.

Now, during booting, I get the message 'STinG is not loaded or Corrupted'

Is STinG suppost to be in the auto folder? Or does it need to be run from
desktop?

Actually, it should look something like this:

C:\AUTO
DRVIN.PRG
SCC.PRG
STING.PRG
STING.INF <=contains only one line: "H:\NET\STING"

C:\CPX (or wherever you put your CPX files).
all STiNG's *.CPX files

H:\NET\STING (for example)
all STiNG's *.STX files...
RESOLVE.STX (must be the last in the list, AFAIK).
DIALER.PRG
DIALER.RSC
DIAL.SCR
DIAL.INF

Note that the dialer can be loaded as an accessory, which is pretty neat, because you can load CAB or NEWSIE before connecting, thus saving online time. In this case, copy DIALER.PRG, DIALER.RSC, DIAL.INF to the root.

DIAL.INF contains the path to the *.SCR files.

H:\NET\CAB
CAB.PRG
CAB.RSC
CAB.OVL

H:\NET\NEWSIE
all the Newsie stuff...

That should get you started... I hope ;-)

641. Re: ATARI Fair in Neuss

Newsgroup: comp.sys.atari.st
Date: 1998-04-09 00:00:00 UTC
From: Carsten Krumnow <krumnow@uni-koblenz.de>
Message-ID: <Pine.SOL.3.92.980409172702.17103A-100000@marvin>
Source record: 103638

Hello everybody!

> Did anybody go to the Atari Show in Neuss, Germany? A small report would be
> nice. How is the Milan coming? Did they show production models?

I have been there. For me it was quite successful beacuse I met the
developer of PPP-Connect and he hacked a little patch for my internet
problems (not yet complete...).
Besides I met many interesting people (Uwe Seimet for example, hallo!)
;-)

Now to the more interesting things:
The Milan was there, two prototypes, from which one of them was
equipped with the StarTrack card (hard disk recording etc.).
A little compatibility test (a game program called COMBINI, compatible
with all original ATARI models, Medusa, Hades, MagiC PC/Mac, Janus and
GEMulaor) refused to work (it slowed down graphics output of the Milan
by approximately factor 1000...).
They promised there would be only a little bug in the graphics
accelerator of the PCI graphics card.

About the speed of the Milan040: I think a Pentium II/233 with MagiC
PC would be faster (though more expensive).

Besides of that it was more or less a small computer antics market. No
really important new products there: Application Systems sold MagiC
5.2 (version 6 is not yet ready and nobody knows about it's features
yet), NVDI 5 is not yet ready (nobody knows about it's features...).

Linux 2.0 was announced, but I missed the presentation.
They told me a GEM installation package for the next revision
(important for me, because up to now I have been to dumb to install it
correctly on my TT...).

invers media presented CALAMUS98 (still under construction). I asked
for non-modal dialogues and they said it will come in one of the next
updates.

Calamus for 32-bit Windoze (95, 98 and NT) was dumped for DM50 to 100
(about US$ 30 to 60)! It is compatible with the '96 ATARI version in
both directions (apart from True Type fonts), but many filters and
modules are included, as well as MGI Photo Suite, an picture editor.
I admit I was surprised and a little bit jealous because the ATARI
version is still at about DM700 (US$ 412).

I think it's enough now,
I will post or mail more information if there is interest.

So long,
Carsten

643. FS: Atari STe System and Software

Newsgroup: comp.sys.atari.st
Date: 1998-04-10 00:00:00 UTC
From: demidem@aol.com
Message-ID: <1998041021215200.RAA15809@ladder01.news.aol.com>
Source record: 103440

I'm am selling:
Atari 1040STe with TOS 2.06 and 2MB RAM
Atari SC1435 Color Monitor (14" screen, stereo)
Atari SM147 Monochrome Monitor (also 14" screen)
Video switcher for changing which monitor to use (much better than unplugging/plugging in the monitors)
90 MB SCSI Hard drive

These items have boxes and/or manuals>
Productivity Software:
1st Word Plus, Word Writer ST, XBoot, Warp 9, Diamond Edge, Multidesk Deluxe, GramSlam, Image Cat, Abbreviator ST, Stereo Master
DTP: Pagestream, Silhouette, Qwikforms

Games:
Frontline, Borodino, Universal Military Simulator, Annals of Rome, Stellar Crusade, Global Commader, Roadwar 2000, Pirates, Gods, Cadaver, Knightmare, Battlehawks 1942, Disciples of Steel, Chessmaster 2000, Dungeon Master, Their Finest Hour, Risk, Space Crusade, Universal Military Simulator II, Space 1889, Afrika Korps, Computer Third Reich, Air Bucks, Great Napoleonic Battles, Fire-Brigade, War in Middle Earth, Gold of the Americas, Empire, Balance of Power

These are on the hard drive and/or disk, but have no manual:
Degas Elite, BStat (statistical program), EZ Grade, Home Accountant, Soundlab, Starstruck the Astrologer, Tracker ST (database construction), Better dead than alien, laser chess. There are literally dozens (probably about 100-150) disks, some are originals of the software on the HD, some are software items that are not on the HD. There are also about 15 or so demos for the ST, also Pagestream has dozens of fonts and hundreds of images for publishing purposes. These are a few programs like a video and audio collection database. These is also a program called Cardfile which allows you to keep a phone/address book, among other info. Additionally, this includes the Atari international guide to TOS software.
This ST has been optimized with an OS upgrade and graphics accelerators. There are a bunch of utilities on the HD, one for cacheing the file listings which speeds HD access, one for decompressing compressed files, etc.
Looking for offers in the $300+ range (buyer pays shipping), but will consider any reasonable offer.

Aaron

I have a disk box, its an 80 or 100 capacity box approx., with
software on their original disks. All but three have NO boxes,
some have instructions, some don't. There are around 44 software
titles, some need instructions & some don't; some are one meg
program, e.g. Lemmings 2 'The Tribes', some arn't.

The whole lot weighs in at 1.8 kilos.

Now the important bit, The price. 30 UKP
Including Postage. (UK Only)

Cheers! for now

I have MagiCMac on my LC475 which is an LC68040. Magic runs very well on this as a 25MHz machine but on my 100MHz PowerBook 5300 it runs slow as hell. This is because the PPC603 emulates only a 68020 chip, not a 68040 and I find Magic agonizingly slow despite having a 100MHz PPC. Has Mac/Motorola done something to improve the emulation of the 68K chip on a G3 or is it just generally faster? How does MagicPC stack up since it is obviously emulation too?

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Does this actualy make a difference? Just checked my folder in
unsorted view, and it's not the last STX but everything seems to work
OK. A few weeks ago when I was trying different module sets for FTP
compatibility I was copying these files around frquently with no
regard to their order and had no trouble with the resolver.

From: Louis_Holleman
Message-ID: <a080ba08@p81.f503.n286.z2.fidonet>
Source record: 103444

Hi all,

I received my account today, so I childishly thought: hook up and go!

Completely wrong. First I discovered I needed quite something else than the login file that I got with my Sting. After finding out what had to be changed I got Sting dialing my provider OK and got a connection, that looked OK, but didn't do anything. This finally turned out to be a missing ROUTE.TAB in the right place. So I solved that problem and the connection finally pinged to my ISP as well.

Next I hooked up Newsie, got it connected to my host, received 1 E-mail from my provider and subscribed to comp.sys.atari.st. So far so good. Next was checking CAB, this worked fine too.

So exit everything and check the mail. Next I wanted to get the first news, but on the next dial-in Newsie refused saying "can't resolve hostname".

It turned out my ROUTE.TAB had somehow got corrupted. Replaced it with a new one, hooked up again, went into CAB (all fine) and next tried Newsie again. Same message. Disconnected, checked route.tab again and heck, again corrupted. Put the original back again, then dialed the ISP and went straight to Newsie. This time an error-message from MagiC and Newsie didn't come up. Broke the connection again and checked the Route.tab, corrupted again!!!

So, what's the problem? I've got Sting 1.06, Dialer 1.10, Newsie 0.80.
It went OK just one time, that's it. How can my Route.tab get corrupted everytime I dial up? So far I checked out it hasn't got to do with CAB, the last time it happened I didn't use CAB at all.

I've got a TT with 4Mb ST-RAM, 16MB TT-RAM, Magic 5.01, NVDI (for Matrix) 4.12, Sting is last in the autofolder, all the programs needed from HSModa07 are there, Wdialog is somewhere run and I'm using the Liberty library needed for Freedom.

Now, I finally tried Sting dialing up, pinged for a moment and broke the connection, checked the Route.tab and it is still fine. It looks like Newsie is screwing me up here...

Anyone with a suggestion? I could upgrade to 0.86, but is that a solution?

BTW: my new E-mail adress is louis@holleman.demon.nl but Newsie should be working fine first before you can use it :-(

651. Old Atari & Games for Sale -- Ottawa

Newsgroup: comp.sys.atari.st
Date: 1998-04-10 00:00:00 UTC
From: bw803@FreeNet.Carleton.CA
Message-ID: <6gjrj6$svv@freenet-news.carleton.ca>
Source record: 103515

We live in the Ottawa area and have an Atari 400 computer which is
up for sale. Below is a list of equipment and programs. If possible, we
would like to sell all this as a package, so as not to be stuck with any
leftover things which we couldn't use. All items sold as is.
Reply by email with an offer if you're interested.

Hardware:
Atari 400 home computer with cables
Cassette program player
2 joysticks

Cartridges:
Pac-Man (game)
Centipede (game)
Qix (game)
3-D Tic-Tac-Toe (game)
Miner 2049er (game)
Basic (programming language)
Pilot (programming language)

Cassettes include:
(these we bought)
Zeppelin (game -- good one!)
Fort Apocalypse (game -- good one!)
Outlaw/Howitzer (2 games)
Eastern Front 1941 (game)
Clowns and Balloons (game)
Touch Typing (typing program)

(these came as the 80's equivalent of "shareware")
Goldrush (game)
Ski (game)
Chicken (game)
MasterMaze (game)
SpeedDemon (game)

plus some miscellaneous cassettes.

Manuals (thrown in for free) include:
Owner's Manual
Your Atari Computer
Atari Basic
Atari Sound and Graphics
Kids and the Atari

Hi! it is my first attemp to this newsgroup, I'm not sure if will work ok!

MY name is Bernard Diotte, I held a store name MICRDEL, and I was selling Atari only, I still have lots of stuff like your are interesting in.

I know people here that want sell there TT, any one interested?

Sory for my english, you know quebecers!...

my Email is berny.diotte@sympatico.ca

May it help!

Look up Robert Schaffner's homepage at:

http://www.rhein-main.de/people/robert/homepage.htm

or buy "ST-Computer/Atari-Inside" at a bookstore at
your railway-station.
You will find lots of dealers left ...

In case there are problems with Big-DOS please report them to the author
Rainer_Seitel@ka.maus.de. (No mails > 16 KByte please.)
If something doesn't work with HDDRIVER and Big-DOS but does work with
HDDRIVER and MagiC this is most likely a Big-DOS problem.

At least with CDTOOL or SPIN! this is no problem. One of my CD-ROM
drives is set to 512 bytes per sector. That is what the Sun needs and it
also works with my Atari. My other CD-ROM drive has the normal (i. e.
2048 bytes per sector) settings and this also works.

659. Newsie screwing up?

Newsgroup: comp.sys.atari.st
Date: 1998-04-10 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <892214671.29464.0.rover.c3adfca1@news.demon.nl>
Source record: 103523

Hi all,

it looks like my Internet stuff rolls, but Newsie is giving me headaches!

I started with v 0.80, and everytime I run Newsie I'm left with a corrupted
Route.tab in my Sting folder. To be exact: the first 4 lines of Route.tab
turn into garbage, and the # characters on those line disappear.
This morning I replaced it by v 0.86, but the same thing happens.

Otherwise there seems to be no problem, just this thing. It means everytime
I used Newsie I have to replace Route.tab by the original one, not exactly
user-friendly.

Suggestions are welcome, and I hope this msg gets thru' :-)

The "General Setup" CPX has that info available also. All you need to do
is click on the "options" button and the dialog box will give you the
TOS version and available memory.

I have a bundle of Atari ST software for sale for $32.50. The bundle includes...

Original Discs, box and docs
Drakkhen (Infogrames)
Omega (Origin)

Original Discs and docs
Empire (Interstel)
Virus (Firebird)
Silent Service (Microprose)
Defender of the Crown (Mindscape)
Carrier Command (Rainbird)
BB/ST (QMI)
Combat Course (Mindscape)
Terrapods (Psycnosis)
UMS (Rainbird)
Test Drive (Accolade)
Rogue (Epyx)
OIDS (FTL)
Starglider (Rainbird)

And 16 magazine disks with demos, games and utilities (Mostly Atari ST User and ST Action stuff)

Email if interested.

I haven't had that specific problem, but I have had NEWSie erase files it has
no business touching. The cure, if possible, is to set the affected files to
read-only status (certainly possible with ROUTE.TAB), so that it can't do
anything with those files.

So just set that ROUTE.TAB file to read-only status, and you'll no longer
have to replace it. Not the most elegant solution, but it will work. You
just have to remember to change it back to read/write if you need to edit i

667. Atari user groups

Newsgroup: comp.sys.atari.st
Date: 1998-04-10 00:00:00 UTC
From: atari@ebox.tninet.se
Message-ID: <6glp7j$57j$1@cubacola.tninet.se>
Source record: 103531

Hi all!

I'm just up to inform You about the Swedish Atari Club (SAK) and I'm forced
to use all available channels to get in touch with as many possible and
presumtive swe Atari users, as possible.

I'm also aware of (some) of the etiquette at these News usergroups here.
There's opinions when someone send a article about his/hers homepage etc.
Maybe someone can tell me and others what is not ment to be here.

o.k. this very question belongs here: How's the status in other user groups?
We had a dramatical 50% member loss in a two years period. Something has to
be done, this is a common Atari user groups problem, isn't it?

I can't reach the atari.user.gps at CIX or can I? Is this newsgroup CIX only?

Well, I'm hired to... :)
My active time in SAK is only two months old and just became chairman.
My primary goal is to stop these losses and preserve the club.

so, help me out, Roy Goring, Harry Sideras, Antony Lacey, Graham Hurford,
Dan Dreibelbis, Terry May, Al Goold and others, your experience is well
known and respected or help me God (or us). Any advice or ideas are welcome.

Info about SAK, its two local departments, our BBS (STraight BBS) is available at:
http://www.pedserv.gu.se/janne/sak.html

Best Regards

Mille Babic

668. HELP: Notator SL 3.16 Comms prob with JV1080

Newsgroup: comp.sys.atari.st
Date: 1998-04-10 00:00:00 UTC
From: mariushf@aol.com
Message-ID: <1998041019093000.PAA25734@ladder01.news.aol.com>
Source record: 103532

Why do I keep getting "MIDI Communication ERROR"
on my Roland JV1080 when I hit <STOP> or <CONT>
on Notator SL 3.16 running on Atari STE.

Always had this problem.
Can't ignore it as it messes up all my pan and vol settings.

Doesn't happen when controlling the Roland via an old Yamaha QX5.

Presume a setting needs changing in Notator. Have tried CLOCK OUT and
POSITION POINTER with no change. Is this a known bug?? HELP!!!!!!

Have posted this query before with no response. So please, if you have a clue,
let me know.... even if it is months (or years) after the date of this email.

You change the size or location while the window is open, and click on
Preferences menu 'Save Preferences', and the window locations are
saved on file.

Editing the prefs manually is difficult because I realy didn't think
it would be worth documenting which was which.

Yes, completely removing the window positions line will reset to the
default locations. The Status Window is window 0.

> finally none.

For me, NEWSie pauses if any new articles are received in the newsgroup currently being downloaded for offline use. At peak times this can cause quite a few delays (about 30 seconds for each article). The busier the newsgroup, the more delays encountered.

But FireNews seems to retrieve just those articles that are 'new' during initial log-in, so it doesn't pause for new arrivals. For instance, even when I do a post with FireNews, that article isn't available to me until the next log-in. This is the opposite of what NEWSie does, as it sends the post first and then retrieves the new ones. FireNews, on the other hand, grabs all new articles first and then sends the post. The same goes for new articles 'just in' from other servers -- they're ignored until the next log-in. NEWSie is more 'immediate', which can be a good thing.

All this is somewhat difficult to explain, but there's definitely different server interaction going on when comparing the two newsreaders. (To clarify, a program called Babel actually does the server work for FireNews.) Give it a 'go' and see how it works with your particular server. Version 0.76 has just been released, and although it's still an incomplete program, it has wonderful 'touches' (as does NEWSie).

You can download FireNews at:

http://www.alfaskop.net/~faltrion/FireSTorm/

Perhaps because it's an STe, upgradable to 4 Megs with cheap SIMMs. Just a guess. I had a Mega 2-great machine, but I would often hit the RAM ceiling with a relatively simple Calamus file.

BTW, users of Calamus 1.09n; if you try to load an IMG file, and get an error message "wrong file format" it often really means "out of RAM". Unload some ACCs and AUTOs, and try again.

Yes, you`r almost right. In the Control Panel I have it`s in the General Setup under "STATUS". But the module I use only tells TOS version, TOS date, ST free ram, but not TT free ram or fast ram.

If these machine they were showing looked like there were coming
from the production line then I wouldn't give a dime for it.
From what I've seem they were far from ready.
In the five minutes I was looking I only saw a monochrome screen and
one system crash. Not very impressive if you ask me.
One possitive thing, they were demonstrating the Startrack card with
some very nice music (Deep Purple stuff).

Yep, there are lots of them.
For instance the Whiteline CD series Alfa, Beta, Gamma and Delta
contains more then 800 Calamus fonts each. Most of then are just junk
but there are some very nice ones.

> * Is there anyway to create your own fonts ?

Also yep. Fonty for instance. With this low cost prog (ï¿½7.95) one can
convert Postscript type 1 fonts into Calamus CFN fonts. It's also a
fully featured font editor. Available at FaST club
stclub@cix.compulink.co.uk.

A more expensive editor is Type art v2.00 (199 DM). Available at
Inversmedia verlag http://www.invers.de

You mean: you donï¿½t know about the features :-) Isnï¿½t it quite normal
that developers donï¿½t like new features promised until they work?

If youï¿½d stayed a bit longer, youï¿½d know why it was monochrome: because the software was not ready. Itï¿½s not a hardware problem. The Milan was running in color, too, but with some bugs when redrawing the screen. So Michael (Schwingen) chose monochrome. The accelerator support was not ready yet.

> http://people.delphi.com/greg_evans

I thought you could already do this with the dialer and CPXs, though
personally I find it easier just to edit the files in a text editor.
It would be easier (particularly for new users) to have the whole
thing integrated into one program rather than spread across three or
so, but I think it's split like it is because STinG does more than
just dial-up networking.

That said, IIRC I think Peter has been rationalising things by moving
the dial-up bits into the dialer anyway over the last few releases so
you don't need to mess with the CPXs unless you specifically want to.
If this isn't fully completed, it's in the pipeline I think.

Nothing but a famous fido offline reader.

> FireNews tip: delete the 'Date:' line before queuing a post. Otherwise it
> won't reflect the "date that the message was originally posted to the
> network", as RFC 822 words it. My system clock was off by two days, and

Perhaps it's not almost correct, but it's mostly a problem for FireNews itself to show the correct date of the message to be sent. It's good (and the same in the header for both messages) when it come back from the news-server. It's correct too in Okami.

FireNews seams to have problems too with long References headers, but again only for it to show the correct threads.

BTW, if some French people reads here (sure there are), I've just translated the rsc file and I'll put it on my pages if Ch. Andersson don't disagree.

I am looking for the ST versions of Sundog: Frozen Legacy or Bloodwych. I used to have these on my old ST, but long ago sold the machine. Now I have in my posession another ST, and want to play two of the best games for it IMHO. I honestly don't care if they are copied disks, originals, or what. I also don't care about manuals or boxes. If you have this, and wanna make a little money, email me please!

Yeah, I have that problem, too, but not with PPP-Connect. I think it's just a coincidence when it happens with JPEG images, though, as I have the same problem with other types of downloads, even html pages.

It might be nice to have a GEM front-end for DEFAULT.CFG, but the Dialer already provides a pretty nice GEM front-end for DIAL.SCR, and it DOES load your previous settings.

Depends on what the garbage is. On my system it's a small section of the
window. I think it's because the window is just a bit bigger than the
displayed text. If you shrink the the window a pixel at a time, eventually
the bit that is scrolled up disappears. A quick save of the prefs and it's
gone.

Mind you, this only works for the article window. I've not tried it with the
article overview window, and it doesn't work with the group window. It seems
to be locked at 150 pixels high.

From: greg_evans@delphi.com
Message-ID: <Ztdlyf9.greg_evans@delphi.com>
Source record: 103452

I'm thinking about writing a GEM program for the creation of STinG's configuration files, default.cfg and dial.scr. I don't think I can make it as slick as I-Connect (PPP-Connect) and the first release will probably be write-only. You'll be able to create new files, but not load and modify existing ones. I plan a menu driven program with dialogs to collect the relevant information, similar to the way CAB and Newsie are configured.

I'd like some feedback on the usefullness of this program. Peter, if you have already written this or are planning to, please let me know. When it's available it will be located on my web page: http://people.delphi.com/greg_evans

Hello, Pascal... what is Led?

FireNews tip: delete the 'Date:' line before queuing a post. Otherwise it won't reflect the "date that the message was originally posted to the network", as RFC 822 words it. My system clock was off by two days, and the post I did at that time ended up with the wrong date. Your news server will add the 'Date:' line when it's posted and include a proper time zone designator.

Greetings to all,

I have Magic PC and want to load some original Atari disks (Lottodds in particular), but MagiC (and the PC both) show an empty directory on all my Atari disks.

Something I am doing wrong?

Anything I can do to fix it?

All advice gratefully received.

Dave Brook

I have an ST which has been stored in a box since I bought my first PC in 1990. We fired it up a shortwhile ago and is still in good working order. It is an ST, not STe, but I have a ton of software, incl a wordprocessor, all the original docs, etc. The system has not been modified or mangled in anyway. I do believe we bought a second external drive that goes with it.

If anyone is interested, let me know. I don't know what these systems are bringing, but someone should be able to advise me. I saw one in our local paper here for I think 300 or so....I'm the n/g participants will let me know what's fair. Email me if there is any interest.

Do you mean the CPX which allows you to set the serial port rate, ie
serial.cpx? This seems to be harmless.

In any case the modem makes contact with the fax machine but then fails once
the page has been built with the "retraining" message. I'm pretty fed up
with this situation, I can't point the finger of blame at anything other
than the modem really, since I'd gone right back to a very basic auto folder
with just HSmodem in it.

>This is with a GVC modem.

I'm surprised that this one isn't working. I'm going to have to ring the
supplier and see what they have to say (if anything). At least it came from
an Atari supplier so there's some hope.

You're right. The clock setting utility will not cope with Y2K but both the clock and the Auto folder prog are both fine apparently.

>bugger!!!
Yep. I spoke to the "custodian" of the remains of Marpet and there seemed to be little chance of anything being done.

If anyone knows what the IC is on the cart I suppose it might be possible that a suitable utility could be written (assuming programming skills of course :-))

Sting seems to have brought back the notorious JPEG problem for me. Using the most recent Cab.ovl and CAB 2.0, CAB displays the message "waiting for data" and ticks all the way down. This happens on about 1 out of 10 jpegs. The same problem does not occur with STiK. Anyone else experience the same difficulty or know how to correct this problem?

I have been using Pagestream to produce PostScript files that I later convert to Adobe's PDF format using Acrobat 2.1. For some reason if I use more than one imported GIF in the document, I get an error and failure when trying to convert to PDF.

Has anyone else had this problem? Also, is there an Atari program that will let me combine individual GIF files into one large GIF?

Apparently you can get refurbished Falcons for a
good price from Titan Designs in the UK. The
built-in hard drive & high-density floppy make it
worth getting, IMHO.

Or you could check the Atari dealers for recycled
stock via http://www.tmisnet.com/~strads/hq/sources.html#Dealers

Date: 1998-04-11 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6gol9fasj2@heliodor.xara.net>
Source record: 103480

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

There has been a few bug reports mailed to me so this issue is the NEW version, V1.1
Bugs are mostly end of files been cut off and a few files which were missing off the disc. A few other Shell bits have been updated as well.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone. If there isn't then why not write about it or suggest new pages. If you don't then we won't know will we !!

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail in the coffin for ATARI. Any articles are welcome, If you have idea on one
why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Please support MEGA NOW, If we don't get some REAL support for issue 3 then we may not produce another zine, Its up to you .

If you would like to help but don't know how then please feel free to ask me waht you can do.

From Chris Swinson (MEGA DISCZINE)

>will let me combine individual GIF files into one large GIF?

If the GIF files are on the same page, you can save the page as a IMG file,
and convert the IMG to a GIF.

PageSTream has the option to print to a IMG file.

: >LOSE WEIGHT THE NATURAL WAY

I'm suggesting another method : try to install W'95 with lots of devices,
and each time you have to reboot, lift that 17 inch monitor high
above your head.

After 10000 lifts (avg. try-rate), you have the right to throw the PC as
far as you can. (Too bad only hardware can be damaged physically...)

: I don't know about losing weight, I do know how you can lose a few
: pounds though:)))))

My method's free !

[Sorry for this silly post, but I needed to lose some steam]

Hi,

I have some questions about Calamus fonts :

* Are there any freeware or PD fonts for Calamus (SL) ?
* Is there anyway to create your own fonts ?

Thank you,

According to the salesman of ASH the releas of NVDI 5 is forseen for
next month.
>
>>invers media presented CALAMUS98 (still under construction). I asked
>
>I hope that it's much nearer than that, the English version of this was
>reputed to have been despatched from MGI near the end of March (there is
>STILL no sign of it on my doormat yet) :-((

AFAIK Calamus SL98 German version is ready. There was even an april
fresh up for sale (30,-DM). From what I have heard from Ulf Dunkel the
English version is ready but there are still some problems with the
Bridge 2 and the *Toolbox PLUS* modules.
Nevertheless it should be shipped now. I expecting my version next
week. After 9 months is about time I get my copy.
There were also some new (expensive) modules.
e.g. Epson Stylus-Universal-Druckertreiber: 99,-DM
This is a printerdriver for the Epson Stylus 300, 400, 600, 800
Photo, 1520 and 3000 models. The driver comes with control
lines and rasters.

LiBerty: New clipboard. 129,-DM, upgrade from Clipart 99,-DM

Eddie 4: Texteditor 239,-DM. Update from Eddie 2/3 50,-DM.
Upgrade from Eddie Light 239,-DM3
JPEG Import/Export driver: 95,-DM

For the Dutch people. The Dutch version is nearly finished.

>>I admit I was surprised and a little bit jealous because the ATARI
>>version is still at about DM700 (US$ 412).

The basic version costs right now 949,-DM. If you've Calamus S/SL<96 you
can upgrade to SL98 for 597,-DM

>There's lots more stuff that hasn't made it over here to the UK, how about
>Papyrus 6 and what's the latest version of CAB? We're still on 2.5!

Papyrus 6 wasn't ready and in Germany it's still CAB 2.6

From Woller Systems one could buy N.AES 1.2, which is in fact v 1.1.7.
N.AES 1.2 is much better then the previous version. Warning: don't buy
the CD-ROM version. Lots of files can't be read. Right now, running
N.AES 1.1.7 and Spin 0.34, I can't read the CD at all. All I get is
track01.dat and track02.dat. Lucky for me I can read most of the
contence if I use _metados_ under plain tos.
Woller was also selling a ROM-port adapter for the ZIP drive I thought
for 119,-DM

Ofcourse there was also the *Milan* but the machine like it was at the
show didn't impressed me at all. The music at the stand was very good
though (Deep Purple)

For the Hades users there was a TOS update v.G54 for 99,-DM:
Better floppy routines for Atari DD-floppys
Quicker booten
ROM scanning of the PCI-cards
Automatic hardware test with error warnings
Support of PCI network- and SCSI cards

There was also an Xilinx update: 130,-DM
three new Xilinx chips and one serial EEPROM which make
a 20 % quicker RAM access possible.
The Xilinx update is needed if one want to use the PCI-network
card.

MagiC Hades 5.2: 179,-DM
NE2000 compatible Network card for the PCI bus

SCSI-cards: -Symbios SCSI FAST PCI card
-Symbios SCSI Ultra Wide PCI card.

AFAIK it's the fault of NEWsie. BTW: get the latest version of Sting.
>

>Anyone with a suggestion? I could upgrade to 0.86, but is that a solution?

NEWsie is up to v0.88 now but I don't think the problem is solved.
Write protect *route.tab*. That way NEWsie can't shrewed up this file.

You could make use of Okami v1.33 instead, which is IMHO far better
then Newsie. It's an offliner though which means you must use a
mail/news client to retrieve mail/news. For this purpose one can use
the excellent POPwatch (for mail) and NEWswatch (for News). You
probably also need NOS (POP3 version).

Other programs you can use are MYmail (mail only) and Firestorm (News
only, looks a little like NEWsie).

I have a TT I just can't afford to keep. It has a 19" b/w monitor, 14" colour, all-pins monitor switch, CD ROM, internal 300Meg SCSI, too many softies to name, but recent versions of just about everything you'd need, incl. Pagestream, NVDI, ImageCopy, Home Accounts, Atari Works, NeoDesk, blah, blah...

$600, you move it. I live near Ottawa, Canada. I will accept US$ at par, but not Quebecois $3 bills, nor CanTire money. No beer empties either.

I'm keeping my MegaSTe. Not for sale, no matter how much you offer...That much? Sorry, no way. I just can't get used to the TT.

731. FS: Atari STe System and Software

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: demidem@aol.com
Message-ID: <1998041216222701.MAA13459@ladder03.news.aol.com>
Source record: 103290

Atari 1040STe with TOS 2.06 and 2MB RAM (I also have 4 256K simms that I will send along)
Atari SC1435 Color Monitor (14" screen, stereo)
Atari SM 147 Monochrome Monitor (also 14" screen)
Video switcher for changing which monitor to use (much better than unplugging/plugging the monitors)
90 MS SCSI Hard drive

Productivity Software:
1st Word Plus, Word Writer ST, XBoot, Warp 9, Diamond Edge, Multidesk Deluxe, GramSlam, Image Cat, Abbreviator ST, Stereo Master
DTP: Pagestream, Silhouette, Qwikforms

Games:
Frontline, Borodino, Universal Military Simulator, Annals of Rome, Stellar Crusade, Global Commader, Roadwar 2000, Pirates, Gods, Cadaver, Knightmare, Battlehawks 1942, Disciples of Steel, Chessmaster 2000, Dungeon Master, Their Finest Hour, Risk, Space Crusade, Universal Military Simulator II, Space 1889, Afrika Korps, Computer Third Reich, Air Bucks, Great Napoleonic Battles, Fire-Brigade, War in Middle Earth, Gold of the Americas, Empire, Balance of Power

These are on the hard drive and/or disk, but have no manual:
Degas Elite, BStat (statistical program), EZ Grade, Home Accountant, Soundlab, Starstruck the Astrologer, Tracker ST (database construction), Better dead than alien, laser chess. There are literally dozens (probably about 100-150) disks I'll send along, some are originals of the software on the HD, some are software items that are not on the HD and I can't recall what all of them are. Pagestream also has dozens of fonts and hundreds of images for publishing purposes. These are a few programs like a video and audio collection database. These is also a program called Cardfile which allows you to keep a phone/address book, among other info. I'll send along the Atari international guide to TOS software.
The ST has been optimized with an OS upgrade and graphics accelerators. There are a bunch of utilities on the HD, one for cacheing the file listings which speeds HD access, one for decompressing compressed files, etc.
First offer over $275 (buyer pays shipping) gets the lot!
Aaron

You'll need to get some 720kb disks (Double Density as opposed to High Density 1.44Mb). Format them on the PC to 720k (or possibly on the STe if you have TOS 1.62, though *sometimes* PCs barf on STe formatted disks). STs usually have no problems reading PC-formatted disks so that's the safest option. Your problem is almost certainly just the wrong type of disk. Assuming you're in the UK from your email address, you can get DD disks at Dixons and other similar places, though they are usually lurking in a corner somewhere amid the swathes of HD floppies.

>none of them does the work. Can anybody help me ?

The best telnet client I've found for VT100 emulation is Prof.
Boris Cahan's TVT102, available from the STiK software pages at:

http://www.flinny.demon.co.uk

This is for STiK/STinG but may well work OK with MiNTnet if you
install GlueSTiK, which lets you use STiK/STinG clients with MiNTnet.
It's available from the author's pages at:

http://www.cs.duke.edu/~dsb/

TVT102 is the only Atari telnet client that handles graphics
characters (boxes and lines etc) properly IME. The only other way I
know of getting these to work properly is to use the MiNTnet telnet
under X, but that means installing all of X just to get a decent
terminal emulation. Far easier to use STinG or GlueSTiK!

>screwing me up here...

Yes, Newsie is definitely messing with files it has no business
touching! For a long time, I've had an annoying bootup message from
Sting saying: "DNS cache load failed". I thought this was a bug in
Sting or the resolve module, but today I discovered that Newsie is to
blame; it corrupts the cache.dns file in Sting's module folder every
time I quit Newsie :-(
I've now turned off all the log options in Newsie, and this seems to
have helped.

Sorry to jump in here, but Newsie is the odd one out here, I think.
FireNews seems to behave in exactly the same way as Okami, Oasis and
Snews, ie the date and time relate to the time the message is
generated (which would seem to be the point of it, no?). The time the
message was uploaded to the server is covered by the statements in the
Path line in the header, should it have any relevance. This seems
logical to me, as does the fact that news servers fix apparently
broken posts which don't have a date line in them when uploaded. The
same goes for message IDs: the server will give one to the message if
it's missing, but will keep an existing one if the newsreader
generates it.

I haven't a clue what the RFCs say on this but as Okami, Oasis and
Snews behave in one way and Newsie in the other my hunch is that the
crowd is right... This may be related to the fact that Newsie started
life as an online reader and has had offline reading tacked in
afterwards (AIUI).

Just my tuppence worth...

>8859-1 standardizes things (I think it's Win95's default).

Depends what you need the font for, but you might be able to avoid the
problem. Okami (since v1.31 I think) does conversion between ISO
8859-1, -2, -3, -8, -9 and the Atari standard encoding so you don't
need special fonts for mail/news. If you use Papyrus you can select
the encoding scheme for ASCII import/export and RTF export which will
probably see you through most other cross-platform text problems.

For HTML work you will probably need to use entities for accented
characters anyway: I think HTML-Help will do this.

The thought crosses my mind that if you remap your fonts and start
creating all your work with non-Atari mappings you might end up having
trouble with transferring text between your existing Atari software,
but this may in practice turn out to be a non-problem.

What the "Resolving Host" message means is that CAB is really not
connected. If you are using CAB 2.5 the CAB.OVL that comes with the
program will not work with STinG - it is designed for the PPP stack
writen by ASH. To work with STinG (or STiK) CAB needs the CAB.OVL
written by Dan Ackerman, now at version 1.285.

742. Atari Show

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: Sam Casas <scasas@ix.netcom.com>
Message-ID: <3531351C.662B4792@ix.netcom.com>
Source record: 103301

No MIST show to go to this year??... no Houston SAFARI, either???... consider the annual Atari DEUCE show being planned for this fall... read on (updates to follow...):

DEUCE 98

The Atari Users of North Texas (AUNT) Computer Exposition will be coming again to Dallas this November in conjunction with the monthly DFW XChange Super Saturday activities at the beautiful Dallas Infomart. Show date is planned for Saturday the 14th. As with the last three DEUCE shows, the actual show date will be finalized 120 days prior to the exposition. The exposition, along with the Super Saturday activities, charge no admission fees and are open to the general public. The one day exposition is planned to begin at 8:30 AM and run until 4:00 PM. A Friday evening pre-show get together and a post show get together are also being planned.

November is still a great time to visit the Dallas Metroplex. The DFW Xchange Super Saturday activities are a monthly computer extravaganza where thousands of computer enthusiast get together, share their computer interests and enjoy some of the best computer and high-tech electronic buys in Texas. This November will be special for us Atarians because many of our finest developers and dealers will be participating in the activities.

The Dallas Infomart facility, a replica of the famous 1895 world fair crystal palace, is located in the heart of the Dallas commerce district at 1950 Stemmons Freeway (I-35E). The facility is leased by the DFW Xchange each month to provide a community service to all computer users in the Metroplex area. The Atari Users of North Texas is one of many participating user groups that help support this community service by sharing our Atari computer interests, general computer expertise and providing user assistance to our local Atarians and the interested general public.

Vendors are being lined up. Systems for Tomorrow, chroMagic, Crawly Crypt Corporation, and Emmulators have already expressed their interest in participating again in the show. Vendors interested in participating can contact David Acklam at (972) 242-9655 or on-line at d.acklam@genie.com. You can also visit the AUNT home page at http//www.startext.net/homes/aunt.

743. ATARI WEB EDITOR HELP

Newsgroup: comp.sys.atari.st

Try using 720kb disks. The STe should be able to read MS-DOS formatted
720kb disks.

750. End of problems

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <892422714.28258.0.spot.c3adfca1@news.demon.nl>
Source record: 103309

Hi all,

it looks like my problem is solved. I finally simply deleted Cache.dns in the Sting folder and replaced the corrupted Route.tab file by a "new" one.

Next I started Sting, then Newsie online, got some messages/mail and logged out again. Surprise, surprise, Sting had created a new Cache.dns, this time with the names of my own ISP, and Route.tab was still OK!!!

So if I'm getting this right, when starting up don't put any Cache.dns in your Sting folder because if this doesn't contain the right names, it may screw up things.

Peter, may I suggest you leave out any Cache.dns files in any future package? These are simply created as needed and this way future users could avoid lotsa problems.

In the meantime, I upgraded to Newsie 0.88, and the only problem I'm still having is sending postings: my editor saves a file that I'm calling POST0000.TXT or whatever, then I quit the editor, next Newsie creates just another file, but I found again that when I don't save in my external editor, Newsie only sends out a posting with the header lines. (Hence the "empty posting" before. I find this a messy way to handle things. Or maybe I just got everything wrong here :-)

Anyway, it looks like the major problem has been solved now.

751. FST: *LEFTY's* GIANT "U,R,ER" SALE/TRADE LISTING -PART 2

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: leftyle5@delphi.com
Message-ID: <plUrTkM.leftyle5@delphi.com>
Source record: 103310

#
****
04/10/98 --> TRADE LISTING *PART-2* - DISKS (800/C64/IBM/etc)<-- 04/10/98
****
#
NOTES ON TRADE/CASH/COMBO OFFERS (PLEASE READ):
==========
Hi, I have the following Disk listings for Sale or Trade. My "WANT LIST"
is at the end of these listings. If you wish to buy or trade (or both),
make me an offer. Items have not been priced. I'm really interested in
doing some trading, but unfortunately, I also need a bit of cash right
now, so make your best offer and I'll let you know.
#
Most of the items have not been tested, but everything is guaranteed to
work upon arrival or you will receive a replacement for the same disk
(provided I have an extra one), or choose another one of equal value, or
refund your money and/or trade disk at my expense. I have many references
if your interested.
#
If your buying, send me a reasonable offer that I can live with, and it's
yours. I certainly don't expect to give these disks away, but I also
don't expect an arm and a leg for them, either. Make me your best offer
and I might surprise you. Of course, if I receive two or more offers on
the same item(s), then the higher item will be the one considered.
#
If you are interested in making a trade, please specify which item(s) you
have for trade and which item(s) you would like to trade for or are
interested in. Please be as specific as you can with your trades, since
this will allow me to respond back in a quick and efficient manner. I'm
ready and willing to trade multiple disks for disks in my "WANT LIST".
Again, just make me a reasonable offer and I'll let you know.
#
Cash offers on disk(s) that are "R/ER" will be placed on "HOLD" until all
trade offers for these disks have been looked at (unless, of course,
someone makes me an offer that I can't refuse ;)). I will notify you
if your offer(s) have been placed on "HOLD". Items placed on "HOLD" will
remain their up to a Maximum of 1-week.
#
I will also entertain cash offers or combo offers (cash + trade), but will
only accept those offers that I feel are reasonable. Of course, the cash
and offer goes both ways. If you feel that an item that I want is worth
more than the item that you want to trade for, then make me a trade offer
and include a reasonable amount that you want for it besides.
#

Please DO NOT send me your complete listings of carts to trade (except for Sears carts -See "WANT LIST"). Use my WANT listing and send me offers only. Thank you for your cooperation on this request. All offers will be looked at and responded to, but not necessarily accepted. However, please be patient for any and all responses.
#
Carts in my "MOST WANTED LIST" take preference over carts outside of this list. You will find a wide variety of carts that I'm interested in, but the carts at the beginning of this list are the ones that I am most interested in. Most of the carts I have to trade are in very good condition or better and all work good. If your interested in the condition of a cart, please make sure you ask about it up front.
#
I will do my best to respond to all offers within 2-3 days, depending on the amount of offers that I receive at once. Shipping will be shared amongst myself and the tradee (I ship mine/He or She ships theirs) either by USPS (my preference) or UPS. Overseas trades are welcomed, but my preference will be given to NTSC games and shipping will be either by Ground or Air (depending on the agreement - NOTE: I prefer Air!).
#
Well, that's it. Remember, I may not accept every offer, but I will also not be insulted by any offer that anyone gives. I'm here to trade and sell, just as you are. All that's needed is for us to arrive at a mutual agreement. Just make your offer and see what happens. Thank you for taking the time to read & look through this large, but worthwhile listing.
#

======================== START MOST WANTED LIST ==========================
I am very interested in acquiring the following carts. Carts preceded by
an asterisk (*) will take first preference, followed by NTSC carts, and
finally PAL carts. I expect most of these to be loose, but if they come
with a box and/or instructions, that's fine too. I realize that some of
these carts may be extremely hard to get, but they are the ones that I'm
most interested in. Thank you.
#
ATARI 2600:

752. FS Mega 4 STE System With almost everything ever released for the ST's

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: JC <jcarreira@blazenet.net>
Message-ID: <6grjnbddf1@news2.ispnews.com>
Source record: 103311

I have an Atari Mega 4 STE system for sale with almost everything you could think of included:

It includes so much stuff that I can't recall it all... But will accept the first reasonable offer including shipping... I would like to sell it quickly... So if you are interested... Don't wait... You might be missing a great opportunity...!!!

Items included:

Mega 4 STE w/ 4 meg ram and newest TOS 2.06 ?
2 Floppy 3.5 drive (1 - 1.44meg and 1 - 720k)
2 Syquest 44 meg removeables with about 15 Cartridges full of ST and MAC software
Quantum 100 meg Hard Drive
ICD Host Adapter
Monitor Switchbox
Hand Scanner and Software w/ scanning tray
Spectre GCR Mac emulator Cartridge
3 mice
trackball
2 joysticks
Separate case and power supply for the drives etc...
Modem

And MORE... If you ask I probably have it...

Software:
All of the major programs are originals including Manuals

LDW Power
Calamus
Pagestream 2 (and all earlier versions)
MAC os 6.?
diamondback
Most of the Codehead Software Utilities...
etc...etc...etc...

Games (again... Just about anything you could think of... I have it... and usually it's an original with manuals etc... I have literally hundreds of disks for this system... Not including whats on the Removeable Cartridges...

I would like to sell this system as quickly as possible... and will accept the first offer I find reasonable... Please E-mail me with any questions and I will respond promptly...

Again first come first serve... and Thanks for taking the time to read this...

Joe C..... jcarreira@blazenet.net

>there for sometime and that says ERROR. File not found. Can someone
>tell me what the hell file it is looking for ? Thanks for your help
>in advance

This is a two-part answer as there are two things going on here.

Firstly, STinG is obviously failing to resolve the DNS name for the host you're trying to connect to (resolving the name means converting the name into a numerical IP address which is what programs actually use for the connection: the names are for human convenience :-)). This could have several causes, so check the following:

1) You're using the correct CAB.OVL (ie *not* the Iconnect one which comes in the CAB package but a late-model STiK/STinG one (1.25 or later)

2) You have set the NAMESERVER variable in DIAL.SCR to the correct numerical IP address for the one your ISP provides. You can have more than one nameserver if your ISP provides more than one machine. The address has to be numerical as you need the nameserver to resolve DNS names so you have no way to resolve the DNS name for the nameserver itself, if you see what I mean.

3) Check that your ISP hasn't had a problem with its nameserver: it may be/have been down for some reason.

The second part is to do with the way CAB interacts with the OVL. As I understand it, when you try to connect to a URL, the following happens:

1) CAB asks the OVL to get the page from the remote host.

2) The OVL uses STinG to resolve the address into an IP address and proceeds to connect to the web server.

3) The OVL downloads the file to CAB's cache.

4) CAB reads the file from disc and displays it.

What happens when STinG can't resolve the host name is that the OVL times out. As the requested file hasn't been written to disc, CAB can't find it so it complains to that effect. It's looking for the

downloaded file which isn't there.

>Anyone with a suggestion? I could upgrade to 0.86, but is that a solution?

There has been quite a bit of discussion here recently about Newsie
corrupting various files. This still seems to be a problem with 0.86,
so I would guess your immediate solution would be to use something
else for mail, news and FTP.

Options:

POPwatch/NEWSwatch for mail/news transport with one of the following
offline readers:

Okami 1.33 (I currently use this: nice features
including filtering and MIME support)
Oasis 1 (I used to use this: Oasis 1 doesn't
thread articles properly, though)
Oasis 2 (Oasis 2 only works for some people and
is expensive to register/no longer
supported)

POPwatch/NEWSwatch may possibly work OK with other offline readers
which use NOS format downloads (eg SNews and the mailer which come as
part of Demon's startup package for NOS).

or:

Firenews/Babel for news (beta, IIRC) with either Antmail, MyMail or
Infitra (likewise beta) for mail (only tried Antmail myself: seemed OK
but a little short on features)

For FTP I'd recommend AFTP.

All the above work happily with STiK/STinG.

BTW no disrespect to Newsie (I know it has lots of fans and the author has put a lot of work in on it), but I never really got on with it when I tried it out and I wouldn't currently want to use it while it keeps mangling discs...

>Do you mean the CPX which allows you to set the serial port rate, ie
>serial.cpx? This seems to be harmless.

I have serial.cpx and sting.cpx, and I didn't check to see which was
causing the conflict. In any case, serial.cpx shouldn't be needed
with STFax.

>In any case the modem makes contact with the fax machine but then fails once

I can't really give you any other advice. Maybe there's some modem
setting to change. I'm using AT&F for the init string.

Do you have problems both sending and receiving?

>It turned out my ROUTE.TAB had somehow got corrupted.

Apparently NEWSIE is causing this problem. Someone else suggested
making ROUTE.TAB a read-only file, since it shouldn't have to be
changed anyways....

There's a newer version of NEWSIE (v.0.88?) that may correct this.

Welcome to the frustrating world of Atari Internet.

>>Freedom.

Using Newsie 0.88 with a TT 4/16 MagiC 4.0/Speedo/Nova. Have not had any
problems with it messing with STinG's files. As a point of reference
the earlier versions seemed to like MagiC 4 better than the current
release of Geneva.

Firenews - locks up my computer
MyMail - can't find its rsc file (its there - I checked)

All in all I have had very good luck with Newsie - I do wonder if the
problems people seem to be having might be do to alternative file
selectors?

I use both STinG and STFax with no problems. So long as the STinG dialer
is not activated STFax loads fine. The problem with STFax "retraining"
the modem is generally an indication that it is not happy with the
initalization string being sent. You will also get this message when
connecting with remote fax machines if the class setting is wrong.

Have noticed the same problems - it seems to be related to the on/off
way that CAB accepts data. With all the swiching going on it appears to
put a real strain on the connection with the ISP. I find that although
my ISP says that a PPP connection needs compression enabled, I get
better result by disabling compression. STiK does do a better job of
hanging on the connection when using CAB than does STinG, even using
STinG in the SLIP mode. OTOH when getting newsgroups and E-mail STinG is better than
STiK. So go figure.

On a related note I downloaded the latest version of DA's LayOut and had
a lot of lost connections using STinG/STiK and CAB. Thinking that mybe
the IBM world would be better I tried both NetScape and Opera on a 166
Pentium. Could not even get as far - wound up going back to the TT :).
BTW this was done using the same ISP within 3 to 4 minutes of each
other.

Well, firstly I'd say you should definitely upgrade to Newsie 0.88,
but also to use it with some precautions. Firstly, never boot Newsie
before you log on, only boot after Sting has done its thing and
connected. When you're done, same deal in reverse - don't log off
before first quitting Newsie. As a final precaution, you could write
protect your ROUTE.TAB file (make it READ ONLY in the information
window).

Version 0.88 seems very stable, even correcting (so far) the file
corruption problems with having Window Buffering turned on (I used it
"off" for a long time, but it seems okay now). BTW I have a similar
TT to what you are using.

770. EPS image - how to view?

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: claytone@aa.net
Message-ID: <892364829.752357@slave2.aa.net>
Source record: 103416

Hello Atarians,

I recently visited the Digitech web page to look at a new product and it said they had downloadable EPS image files of their products, so I'm thinking "Hey! Great!, now I can see what that thing looks like up close". So, I got the file (it's almost 2.5 megs!), and quickly found I had no way to look at it. Pagestream has an EPS image import module, but all that shows up is a rectangular box with an "X" in it. I can move it and size it, but no image. Anyboby have any ideas? Are there other ways to see an EPS image?

Thanks,

Clayton Murray

> hell. This is because the PPC603 emulates only a 68020 chip, not a
> 68040 and I find Magic agonizingly slow despite having a 100MHz PPC.

No, thatï¿½s not the reason. The 603 has a small Level-1-cache so the
emulation is done in the mainboard RAM - and this is veeerryyyy sllooooww
on the PowerBook 5300 (only 32 bit access data path instead of 64 bit).
And it has no L2-cache.

Even on an PPC750 oder 604e the 68k-emulation emulates an 68k - but
these chips are fast like hell because of their huge L1-cache and their
existing L2-cache.

So: there are unfortunately some Apple machines which arenï¿½t good
"MagiCMac-machines" (or, in general, 68k-machines), for example the
PowerBook 5300, 1400 without L2-cache, Performa 5200, 5300, 6200 and
6300. These machines have a 603 processor and no (or a small) L2-cache -
and only 32 bit data path access.

MagiC-PC is not as fast as MagiCMac on comparable machines because itï¿½s
much easier for a PPC to emulate a 68k than for a Pentium.

Hope it helps.

Exactly... the character mapping. The Monaco mono I'm using now came with the English version of NVDI 3.2. Like you said, all the characters are already in the font, but to make it conform to ISO-8859-1 I would have to cut and paste them to the proper slots. Instead, I would appreciate it if you could send me your version of Monaco. I purchased NVDI 3.2 legitimately, of course, so asking for the font wouldn't be unethical. If you agree, Hallvard, please send it my way.

> version?

Either through a comment in the font itself or by comparing its character set to ISO references (like in the back of a printer manual). If you periodically see strange characters in the newsgroups here, then you're using the wrong font (like me). I doubt the 8-bit Atari character set, as mirrored in the Monaco mono I use, adheres to any ISO standard. ASCII was officially defined in 1967, with English in mind and only 7 bits to do it, so default 8-bit character sets varied from computer to computer. ISO 8859-1 standardizes things (I think it's Win95's default).

For what you want to do, EPS _bit-images_ aren't well supported on the Atari. I've never used Pagestream but the 'X' you mentioned means the file is placeable PostScript -- only a PS-equipped printer or screen engine can interpret and show it. Otherwise a program would have to do its own conversion of the EPS code and send it to the screen as a bit-image. This can be done on a Mac or PC but I really doubt there's an Atari program, besides maybe GhostScript, that can do this. Perhaps I'm wrong, though.

I'm posting this for someone else:

For sale (Vancouver, Canada):

Atari TT030 (TOS 3.05; double-density floppy), 8MB RAM, 185MB Quantum hard-drive (not the original), PTC1426 color monitor (noticeable 'burn-in' but very useable), original TT keyboard (recently refurbished), newer Eklipse tactile mouse. Everything besides the monitor is in perfect working condition. I've sat down with this system and can vouch for what is stated. Comes partitioned with ICD Pro v6.0.8/Cleanup v5.02 (original disks and manual). US$415 plus shipping.

Contact me and I'll pass on any replies.

??periodically see strange characters in the newsgroups here, then you're
??using the wrong font (like me).

Well, let's test : how do you see the line

???? ???? ?

If you see some E & e with various accents, that means you use a
ISO-8859-1 font.
If you see some e with various accents, that means you use standard
atari font and that your newreader converts latin-1 to atari.
If you see various strange things, that means you use standard atari
font and that your newsreader doesn't make any conversion [or that you use a
ISO-8859-x font, x different from 0, 1 and another one I can't remember...].

??I doubt the 8-bit Atari character set, as
??mirrored in the Monaco mono I use, adheres to any ISO standard.

It does not.
As far as I could see, some variants of the Monaco doesn't even match
the atari coding : hebrew chars are replaced by accentuated capital letters ->
one can write French correctly :-)

? ASCII was
??officially defined in 1967, with English in mind and only 7 bits to do
??it, so default 8-bit character sets varied from computer to computer. ISO
??8859-1 standardizes things (I think it's Win95's default).

ISO-8859 standardizes?; there's a lot of ISO-8859-x codes according
the langages you want to code. 8859-1 is the most common one, the default one
on Internet, because it codes for nearly western-europe langages (but not for
French :-()

Win 95 uses its own coding (of course...), derived from the iso ones?;
the standard one is derived from the latin-1 : codes are identical, except
between 128 and 159 : reserved for control characters in ISO-8859, used for
various chars in Windows-95 (including the one missing in latin-1 for French
-> one can write French with Windows :-), but it's Windows :-(.

>>but there are some very nice ones.

There's also some dedicated CDs for Calamus with many many fonts, some
of them really nice [but some of them awful or difficult to use because of
strange character sorting for accents]. For instance, Calamaximus.

>> * Is there anyway to create your own fonts ?
>>
>>Also yep. Fonty for instance. With this low cost prog (7.95) one can
>>convert Postscript type 1 fonts into Calamus CFN fonts. It's also a

>>
>>A more expensive editor is Type art v2.00 (199 DM). Available at
>>Inversmedia verlag http://www.invers.de

Very practical, in my mind [I didn't tried Fonty, so I can't compare],
and very powerful - especially for making kernings and things like that. By
the way, did you know that the way calamus handles kerning (characters
modelized by 8 boxes) seems to be unique and more powerful than PS way :-) if
font is correctly designed, of course ?
To convert TrueType fonts [or Type 1, I'm not sure], you can also use
Type 2 Type, also from Invers.

788. Newsie's headache

Newsgroup: comp.sys.atari.st
Date: 1998-04-12 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <892387901.21781.0.spot.c3adfca1@news.demon.nl>
Source record: 103434

Hi all,

Gawd, this whole stuff is beginning to p..... me off like hell!

I run my TT 24 hrs a day and only turn it off for maintenance or during heavy thunderstorms. Usually I don't have to reset it either, MagiC being very stable and the only resets I do are for another config or another resolution. Normally I run it in 832x608 24 bit mode.

I use a Matrix TC1208, together with NVDI for that card and that makes it pretty fast, especially during boot-up. So I hardly can read any messages flashing by during the boot.

Since I got this Internet Train rolling on its square wheels, I needed to reset my TT more times in a few days than I normally do in say 2 years.

So just a few hours ago I discovered this "DNS cache load failed" message during a boot again needed, so I checked out the Cache.dns file: this looked very much the same like the "route.tab" file: all # characters followed by plain ASCII text, same contents as the Route.tab, but the last lines were cut off. Next I checked the original file from the archive, this seemed like a binary file with some plain text like "RUTHERFORD.UNI-MUENSTER.DE" between the "garbage-characters". So I decided to replace the Cache.dns again by the original one from the archive. On the next boot the message "...load failed" didn't show up, so I started Sting, next was Newsie and Newsie couldn't connect.

To make a long story short: When the original Cache.dns sits in Stings folder, the DNS cache seems to be loaded OK, but then Sting itself won't ping at all! If I leave the corrupted file, the DNS cache is NOT loaded (as the bootmessage tells me) but the machine pings fine. Eventually I hooked up to Peter's site to pick up the complete package again (just for this bloody Cache.dns file...), then I went to John's site to get Newsie 0.88 (someone mailed me this morning that 0.89 was already out?).

As far as I can check, Newsie corrupts the two files when it's online, so the Route.tab starts with the contents of Cache.dns followed by its own contents, and Cache.dns gets the first half of the contents of Route.tab and the "binary stuff" is wiped out... Very strange indeed.

Furthermore I seized TelSTar from a site, but Telstar won't even connect, saying it can't resolve hostname. I put it in its own directory, also together in Stings main directory, no way of getting it on line. I need something like TelStar to change my password at my ISP.

Apart from that, Newsie is screwing me up on E-mails (receive is OK, but sending is a disaster), just the news goes OK.

Maybe I'll have to pick up ol' Antmail, huh?

Todd-
Currently I have lots of 1040 STF's(1MEG), SC1435 14" Atari
Monitors(RGB) and some software titles. Just let me know if you are
interested and we can work out the details.

1040STF-used, excellent condition, includes Atari Mouse OR 'Marcus'
3-button track-ball- $60.

SC1435 Atari Color/Stereo monitor, used, good condition...$75

Software list available upon request.
Buyer pays actual shipping cost.(UPS fee only)

Hi all,

did some more checking on those corrupted files:

After getting corrupted, Cache.dns seems to be parts of Route.tab, I explained that already.
Now checking Route.tab once more after it got corrupted, it LOOKS like it starts as some kind of binary file, same as the original Cache.dns, but instead of seeing this "RUTHERFORD.UNI-MUENSTER.DE" thing I see "postmaster.demon.nl" and stuff like that: all adresses from my own provider...

Could this mean that not Newsie is screwing me up, but Sting itself, when Newsie gets online??? Like I said, nothing happens when I go out surfing using CAB, it only happens when using Newsie online, but it could very well originate from within Sting... It seems to be writing a cache file for my own ISP-adresses and next messes around with the 2 files. Peter???? Any suggestions???

In the meantime I've got Newsie 0.88 installed (nice going, those http:// references, BTW).

I tested my E-mail again, looks like I've got it under control now :-)

Oh yeah, I almost forgot it's still Easter; have a nice weekend you all!

There's nothing like writing your own HTML code
to get your page exactly right... but if you need
to automate the process, I've heard of a program
called the "Home Page Penguin" that may meet your
needs.

It should be listed in the Index to the Atari WebRing:
A HREF="http://www.webring.org/cgi-bin/webring?ring=atari;list"
target="_top"

If you have to type the URL in, it might be easier to use:
http://www.tmisnet.com/~strads/hq/atari.html#AtariRing

> Path line in the header, should it have any relevance.

Hi, John...

But what if one generated a message offline, queued it, but didn't actually post it until a few days -- perhaps weeks -- later. The 'Date:' line would then make the message appear to have been propagating for that time. Or in my case (not hypothetical), where the system clock was off by 36 hours because of a failing battery.

The RFC states:

The "Date" line (formerly "Posted") is the date that the
message was originally posted to the network.

Perhaps 'network' includes the local machine, but I interpret 'network' to mean the news server. Regardless of the time actually used, FireNews doesn't even include a required time zone designator when the header line is created. For FireNews users, it's best to delete the line and let the server handle it correctly (most likely using GMT).

Does anyone know of a company called CeeJay Software in Illinois run by Carey Cates? He has a second hand atari hardware and software business that he runs out of his house.

I would really like to get his telephone number, address, etc, that is if he's still doing business. He was very big on Genie, but I've never seen him on the net.

Thanks in advance

Tom

799. How To Connect SC1224 To Falcon?

Newsgroup: comp.sys.atari.st
Date: 1998-04-13 00:00:00 UTC
From: Roagie <roagie@hotmail.com>
Message-ID: <01bd6678$66fe6a60$852b2599@Schnappy.pop.weasle>
Source record: 103319
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi-

I bought a SC1224 monitor at a flea market and see it has a round connector, while the back of my falcon has a DB15 male connector. Obviously there is an adapter that is needed...

I would like to make one... Is there any kind of Falcon FAQ available? I saw the ST FAQs and it seems that they lack the technical details I need for pinouts, etc.

Is there a definitive Falcon website I should know about? I'm sure I will have LOTS of questions once I get this puppy fired up :)

If there is none of the above could someone tell me the pinouts and/or forward and docs they may have about the video adapter and it's fabrication?

Thanks very much!
Roagie

While in your editor, a NEWSie post's filename should always be newstest.txt (it's a temporary file). When you queue it, it'll be called post0000.txt. If you do another post in the same session, once queued it'll become post0001.txt, and so forth. You shouldn't be directly editing any of these postxxxx.txt files in your editor, as the posts.pbx file will not be updated correctly. The empty postings you did only included the quoted message body and whatever signature you had defined, which means newstext.txt wasn't modified in any way before it was queued.

OK, I understand now -- the software you're using (Okami) is doing the
remapping itself. Here I thought the font was a factor <duh>.

I really must look into Okami.

You need to sellotape the 1.4MB floppy "hole" on the right... then
format it as 720KB floppy on your PC... that should work.

But why not get yer old ST's disks out and copy onto them?

It's available from your Atari dealer for about $10. to $15.00.

>Is there a definitive Falcon website I should know about? I'm sure I will
>have LOTS of questions once I get this puppy fired up :)

There are lots of sites, with several ways to find them:
1/ Head for a major search engine such as Debriefing
http://www.debriefing.com and type in +Atari +Falcon +Computer
and see what comes back.
2/ Hop on the Atari Webring ... you could start at my site,
http://www.tmisnet.com/~strads/hq/atari.html , and visit many
of the 113 sites available.

>If there is none of the above could someone tell me the pinouts and/or
>forward and docs they may have about the video adapter and it's
>fabrication?

Oh, you should be able to find it if you REALLY want
to make one.

Also there is the Calamus Font Editor from the makers of Calamus themselves.
It runs as a ACC.

Dz, dz... will it be a new tone here, or what?

> [...]
> and enjoy
> the atari st is not sold anymore so you want harm anyone

But you forget the fact that there is a little company who bought all
the rights on all TOS versions. They try to develop version 6 and a
fairly "power without the price" ATARI clone called "Milan".

Copying TOS images remains being software piracy, though I don't know
if the TOS 6 fathers care about that (AFAIK they don't sell older TOS
version images nor ROMs).
If they do, you do the first step to destruct any further effort to
keep the ATARI business going on.

Another thing is the possibility to copy the TOS of one's own ST to use
it furthermore on a new PC with an emulator like PaCifiST. Nobody will
blame you for this I think.
(Strictly according to law, you would have to destroy your ST after
doing so to make sure it will not be used at the same time as your
emulated ST in the PC...)

Wonder Disk #77 had two Civilisation utilities- CIVILFIX (18K), which
contained a patch program to allow it to be played of a Falcon, and a
cheat program (186K) which enabled you to reconfigure saved game files,
altering amount of territory held, what each town produces etcetera.
Nothing about editing the map as such. The earliest Wonderdisk I have
is #67- there may be something earlier.

>everything wrong here :-)
>
With an external editor, passing files to and fro is a bit of a problem,
so Newsie adopts a fairly common approach- it sets up a file
NEWSTEST.TXT with your headers (and the text of any item you are
following up) and passes it to your editor. If you exit your editor
without saving, NEWSTEST.TXT isn't changed, and Newsie then copies it to
a file POSTxxxx.TXT, allocating the next unused number to xxxx. If
possible, set up your editor to do an automatic save on exit. Most
editors will flag a warning if you attempt to exit without saving an
altered file- doesn't yours?

Mail works the same way, via MAILTEST.TXT.

From: louis@holleman.demon.nl
Message-ID: <892463005.5378.0.rover.c3adfca1@news.demon.nl>
Source record: 103336

Hi all,

OK, I've finally managed to sort out the first (and major) problems with my set up, and I'm sorry for John I called Newsie a screwball, but AFAIK now it turned out to be Sting itself to be messing with its own files. Once again, the problem is simply caused by a Cache.dns file supplied with the package, that contains the wrong addresses (these may have been right for Peter himself, but then again, who's got the same stuff as Peter does???). So I suggested already in here to Peter, for heaven's sake, leave Cache.dns simply out of the archives in the future, as Sting will generate one with the right addresses as needed.

So far for that problem.

Neil "instructed" me already on how to handle postings; tks Neil, that's sorted out now too.

Let's just move on to Lesson #3: how the hell is it possible that I'm receiving several messages in this NG (I regularly check the numbers coming in), then when I open the offline box some of them are missing in the Overview. I just checked the Offline folder where this NG is stored, and found the "missing pieces" all OK there. So I just used QED to discover that Charles and Petter had written back on my messages. Sorry folks, Newsie won't show them at all!

Gotta check the log next time to find out what's happening here, but the docs are not too bright on this matter.
The same is for the settings "max articles to fetch" and "show ... items". At the start I'd set the first to 25 and the other one to 1000, but on my first connection Comp.sys.atari.st poured in with more than 50 articles... and to be honest, I simply broke the connection because it kept going on, including all those nasty pauses. So I set them both to 25 and then it went better (although some articles got in but failed to show up in Newsie). Now I've set both to 40, but maybe I should set 1000 again for "show ... articles"? I still need to get to grips with Newsie, I was used to using LED in Fido stuff, but this is slightly different.
Still, I don't consider giving up on Newsie right now, I think it's just that learning process. So, Charles, plead Guilty as you like, but I don't regret hooking up at all :-)

Oh yeah, I recall seeing a posting from someone who thought the corrupting-file-problem was only with MagiC and SCSI drives? Maybe, but I think there eventually will be more users using MagiC and SCSI drives than old TOSsers with old ACSI drives... hence the "strong advise" to Peter R.

OK, that's enough feed for now,

> or 6320. I guess this is a "no-no" then.

Yes. Buy an 6400 or 6500 - theyï¿½re a lot faster than the 6300 (L2-cache,
603e and 64 bit data path).

> I've tried the MagiCMac demo with a Performa 630 (68LC040 processor) and it
> was really fast!!!

Of course - because the OS can run "native", no emulation is needed. But
on an 603e (with L2-cache) or an 604e (with L2-cache), MagiCMac runs
like hell: up to 6-9 times faster than on a 68040.

> But unfortunately many Mac programs these days only work
> on PPC machines, so the 6320 or 6300 seems to be a good choice to get a
> cheap PPC Mac.... I also want the video-input and TV card option which I
> believe only works for Performa machines without having to invest in loads
> of extra money.

I had the same problem. I thought the 6400/6500 machines would be great
for me. But now I want a 7300/7500/7600. Theyï¿½re much better (faster
graphics, more RAM slots, faster SCSI, two SCSI busses). There is no
(cheap) video card for it, right, but they have video input (without a
tuner). So I bought a broken video recorder (mechanically broken, the
tuner is fine) for a bottle of wine from a friend and now I have TV on
my screen, too. :-)

> How "bad" is actually MagiCMac on such a PPC machine? Is it unbearable,
> useless and a total waste of money?
> Or is it perfectly usable? Remember, I'm comparing all of this with an
> 8MHz STe in hires mono, and I'm not asking for the world.

Then you can buy a 63xx Mac. Theyï¿½re comparable to a TT030, faster in
some cases, slower in other. But no 5200/6200!

> You can forget about PCs in my case ;-)
> "Intel outside" as my web page says...

Iï¿½ve a PC here - running Linux on an AMD 5k86. Intel? Microsoft? Whatï¿½s
that? :-)

824. MiNT/Connect95, how to use together?

Newsgroup: comp.sys.atari.st
Date: 1998-04-13 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <35323754ad3161@ping.be>
Source record: 103344

Hey,

I've serious problems with the terminal prg *Connect95* when I
want to use it under MiNT.
If I type a character in the editor of Connect95 that character is
echoing back endlessly.
Someone suggested my to include the following line in the *mint.cnf*:

ren u:\dev\modem2 u:\dev\ttyb

By doing this however I've created another problem. Connect doesn't
recognize ttyb as modemport I guess.
I get the following warning:
CoNnect
Dateifehler
Serial-Port Modem2
T33 Bereichfehler (Arg.)

Serial.cpx says: Serial port is in use and therefore cannot be
configurated.

Anyone an idea how to solve this?

BTW: I do have some kind of solution for the first problem but it's
not so stable. In particulary Okami 1.33 hangs from time to time.
What I've done is the following.
Instead of starting the HSMODA7 drivers from auto folder I start them
from mint.cnf.
For Connect95 this seems to work very well but as I've said before
this way of working gives me also problems.

825. Q: Null modem cable

Newsgroup: comp.sys.atari.st
Date: 1998-04-13 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <35323754ad3160@ping.be>
Source record: 103345

Hi,

Can someone tells me how I must use a nullmodem cable to transport
data between a TT030 (serial2 port) and a Hades 060 (modem1 port).
I suppose I must use a terminal prg to transmit the data. My problem
is that I can't find find out how.

TIA

I try to read all I can get my hands on about the new Milan coming out, and need to find out more about the following things. Now I know they have a web page out, but it'll be a bit before something more informative can be put on it (Unless they already did it).

Does it have the same sound capiblilities as a Falcon? (I hope so since it's suppose to be a Falcon clone)

Will the PCI bus be able to take those Pentium cards that Computer Direct sells? (I think it should)

And can someone please give me the e-mail address of Computer Direct or whoever makes those cards now? It seems they've gone over to selling some Mac applications instead.

Oh...and if someone can give me the e-mail of the company that makes Milan, because I really would like to know more about them before I send any money overseas. Thanx for your help... :)

>connecting with remote fax machines if the class setting is wrong.

Thanks to you and Ross.

It was indeed the init string, AT&F required.

I must have introduced an extra tweak over and above those that I used in my previous modem which was happy with an ATZ.

Thanks for the help both of you, I'm a happy (Easter) bunny now :-))

The sames goes for Avant Plot Vektor. It can load EPS but only some.

If you've lots of money to spent you can buy the Calamus EPS-import
module. The *Calipso light* is for 299,- DM yours. If you want
the full version of Calipso then it will cost you 1.200,-DM.
Ofcourse for that money you'll have a very useful tool.
A demo version of *Calipso* can also be found on
http://www.invers.de

Who said this? The "Verramscher" (sorry, guys, I doni¿½t know an English word for it) (the guy who sold it)? Or inversmedia?

It matters if youi¿½re /working/ with Calamus. A version thati¿½s not updateable and without support is nearly useless in one or two years.

852. Hard Disks

Newsgroup: comp.sys.atari.st
Date: 1998-04-13 00:00:00 UTC
From: "Paul L. Richards" <Paul@grangeway.demon.co.uk>
Message-ID: <892501654.9632.0.nnrp-07.9e980daf@news.demon.co.uk>
Source record: 103372

I have a Atari 520 ST FM
I have a PC formatted 520MB IDE drive
I was wondering if it is possible to connect this drive to a atari, format it and enable me to start using my old atari computer again ?
Or what Hard Disks can you connect to atari's ?
If you could reply to me at Paul@grangeway.demon.co.uk . If I can get a hard disk in my Atari, then I will use that machine alongside my PC. But Until I do this I most probably won't be able to follow this group.

thanks
Paul Richards

853. ezBack and ZIPdrive

Newsgroup: comp.sys.atari.st

From: chendol@wxs.nl
Message-ID: <6gttmp$5ee13@reader2.wxs.nl>
Source record: 103373

Hi,

When I bought my Zipdrive, i got a floppy with HiSofts 'Squirrel Zip/Jaz Tools' with it. As a bonus the Zip/Jaz Tools disk contains a version of ezBack (=Diamond Back light) to backup your harddisk to zipdisks. At least, that is what the readme says.
I've still not figuered out how to make backups to a zipdisk with this program. It looks like ezBack only wants to write to floppys.
Anyone who can tell me how to use ezBack with zipdisks?

Thanks!
Karsten

> I suppose I must use a terminal prg to transmit the data. My problem
> is that I can't find find out how.

Just connect the null modem cable between both machines. Boot up your terminal program on both computers and set one to transmit (upload) whatever files you want transferred and the other computer to receive (download) those files. It works just like it does if you were online transmitting data over the phone lines.

863. Problem nach Beendigung eines TOS-Programms

Newsgroup: comp.sys.atari.st
Date: 1998-04-13 00:00:00 UTC
From: sebastian.bauer@bigfoot.com
Message-ID: <6gui79$ao2$1@nnrp1.dejanews.com>
Source record: 103383

Hallo!

Ich habe die schlimmsten Bef�rchtungen bez�glich der Gesundheit meines hei�geliebten Ataris, da er solche Symptome bisher noch nie gezeigt hat: Nachdem vom GEM-Desktop ein TOS-Programm gestartet und beendet wurde, funktioniert die Mausabfrage offensichtlich nicht mehr richtig:

Die Maus l��t sich noch normal bewegen, aber der Computer reagiert nur verz�gert bzw. �berhaupt nicht auf Mausklicks. Wenn ich z.B. ein Icon anklicke, passiert gar nichts; wenn ich die Maus danach eine Weile bewege, wird das Icon pl�tzlich selektiert (wenn die Maus noch dar�ber ist, sonst passiert der Mausklick halt an der neuen Stelle).

Ich konnte den Fehler schon relativ eingrenzen, und eben das macht mir Sorge: Es liegt nicht an der Maus (bei anderer Maus gleiches Problem), nicht an ACCs / AUTO-Ordner-Prgs (alle abgeschaltet), nicht an der HDD oder anderen Peripherieger�ten (alle abgesteckt au�er Tastatur und Monitor) - es scheint also an der Computerhardware selber zu liegen :-(

Hier noch meine genaue Ausstattung:
Atari 1040 STE, 4 MB RAM (SIMM), TOS 2.06 (direkt onboard ohne TOS-Bridge o.�.), das alles eingebaut in einen Lighthouse-Tower; dementsprechend die Zus�tze Multiboard (das vom Lighthouse-Towerbausatz, nicht irgendein anderes) und nach vorne gef�hrte Reset-Taste, Temperaturf�hler und LED. Ich glaube, das war�s. ICD-Hostadapter, HDD und ZIP-Drive waren abgesteckt. Und die Software interessiert ja hier nicht. Ach ja, ein Virus kann es auch nicht sein; ich habe von einer ewig nicht benutzten, schreibgesch�tzten Diskette neugebootet (nach 15 sec. Abschaltpause)...

Hatte jemand schon ein �hnliches Problem oder kann sich jemand denken, wo der Fehler liegt? Bitte schreibt mir an
mailto: sebastian.bauer@bigfoot.com

Danke!

Ciao,
Sebastian

That's the power supply. I suggest you get a used one from a dead 520ST or whatever you can get cheap.

The schematics are available on the net, the file is called netzeil.lzh, and I remember seeing it on a german FTP, either ftp.uni-paderborn.de, or ftp.leo.org...

Cheers,
Nick

Hi Neil,

I think we're going to have to agree to differ here :-)

Here's my logic (!) FWIW:

For me, the date posted to the network is the date the message is
queued for the first time for network transfer. If you are using an
online reader the first machine is your ISP's news server as that is
where the message is first queued. If you are using an *offline*
reader then it's queued for the first time on your local machine.

The fact that there may be a prolonged wait before polling your ISP's
news server and transferring the message across it's first network
transfer doesn't really enter the equation. The message will then sit
on the ISP's server until it connects to another server and another
transfer takes place: the time gap between polls will probably be
shorter, but the principle remains the same. BTW the state of your
local clock is your own affair :-)

The date of each hop in the chain between machines is stored as an
entry in the header, so you can see the gap between the original
queuing and the first transfer if you wish. With an online reader the
same applies, the chain just starts on the ISP's news server rather
than the local machine.

Another factor is what happens with posts which don't originate on the
internet at all, ie those which are generated on UUCP and Fido

networks, or as mailing lists (some usenet groups have mailing list gateways and are propagated using both mail and news). Messages may have been zooming about a fido network for days before hitting an ISP's news server, so which network counts in this case? Usenet isn't internet-only so even if the header only shows the propagation stages after the message hits the internet (ie NNTP transfers) if the original date is intact you should still have some meaningful indication of the time lag from first queuing.

All the above could of course be total rubbish, but it makes sense to me! Feel free to pick multiple holes... <awaits avalanche...>

As for FireNews's date line being incorrect/incomplete that needs fixing by the author. It's bound to have some quirks being a new program in beta stage at present.

Steve,

Another thing I would suggest is turning off the internal terminator,
chucking the passive terminator, and putting an _active_ terminator at
the end of the chain (CD-ROM).

Dan

Anyone interested in buying the following mags from me?

ST Review Magazines
With Disks (without - 33)
5, 7, 7, 21, 26, 27, 28, 29, 30, 30, 31, 32, 34, 35

ST User
Ranging from Volume 1 issue 1, to the last but one issue October 94.
Around 72 mags in total, including all cover disks where applicable.

I am contemplating selling my full sets of ST Applications, ST Revieww
and ST Formats - dunno yet - but make me a good offer and they will
probably be yours. ;)

Collection from Essex, London or manchester - otherwise a hefty
postage charge.

879. Re: EPS image - how to view?

Newsgroup: comp.sys.atari.st
Date: 1998-04-14 00:00:00 UTC
From: Neil Roughley <roughley@HORMEL.unix.dsoe.com>
Message-ID: <FN_3533a852_roughley@news.dsoe.com>
Source record: 103201

My understanding is that Clayton wants to view an EPS bit-image, not the vector type. If the file was 2.5MB then it does indeed sound like a bit-image. Cranach has a GDPS module that saves PostScript bit-images, but it can't load them -- nothing on the Atari can as far as I know (except perhaps Ghostscript).

Because they're not Monaco <g>. My eyes have become so accustomed to this easy-to-read screen font, and I didn't want to give it up just to read Usenet articles. With ISO 8859-1 Monaco, my screen display is more integrated now (because it matches my system font).

No avalanche here, John -- you have valid points. But I don't understand
this statement:

> The date of each hop in the chain between machines is stored as an
> entry in the header, so you can see the gap between the original
> queuing and the first transfer if you wish.

The server hops are in the 'Path:' header, but no dates are stored there
(at least from my news server).

What about Okami... when you do a post, does Okami include the 'Date:'
header when its editor kicks in?

Actually, what I'm doing is thinking out loud here. Wizztronics has been requesting input from us about the changes / updates / fixes to GEM-TOS we'd like to see. (That's why the cryptic comment about expanding the commands to implement the suggestion).

I've already sent about ten suggestions to toscompinfo@wizztronics.com regarding changes I'd like to see ... such as new calls (evnt_joypad), enhancements (additional icons for form_alert such as a trashcan, a speaker, a movie projector, two-cans-attached-with-string [i.e. networking], the letters RSC within the universal "NO" circle), and new hardware (an RS-485 serial port, used mostly in industrial control applications).

Generally, I try to come up with suggestions that are harmonious with existing GEM-TOS calls and philosophy; another reason I was musing about appl_trecord and appl_tplay.

>your prefs file to me via email, I can see what you window positions
>are.

Well I'm back to the default window positions because I screwed them
up so badly trying to edit them by hand. But the crux of the matter
is that I would change the window size (within Newsie), save
preferences, and I would be back to the original window size (or some
bizarre variation) the next session.

>I find it very strange that you are the only person having problems
>with saving window positions.

Someone else mentioned he had the same problem.

However, I find it very strange that I seem to be the only one having
problems with FTP. I don't think this has anything to do with NEWSIE
but with STinG. It's also very strange that I have just recently
started to get 4 bombs when I try to change the date on the control
panel. And that my modem won't connect on the first try after booting
the computer, but only on the second or third try. Or that STFax
won't accept the presence of STinG, even if it's disabled.

Ah well, perhaps I have a very strange computer, or perhaps it's just
that life is very strange.

Ross MacIver

ps I haven't checked out NEWSIE v.88 yet. Despite all my griping, I
would be the first to buy this software. I like the layout and the
use of multiple mailboxes. But the bottom line is...it's gotta work,
on my system.

Hi Mark

I'm using Gamemaster in Montreal. You can buy blocks of time (I think
it's about $1 an hour for a PPP connection), so it can be really
reasonable for light use. I usually spend about $10 / month.

The number is 523-7979 for 14.4k and 523-2103 for 28.8K.

I can help in set-up if needed.

Hi

Please - someone help me....

My Falcon is now connected to an old colour TV and I have come across a problem - some Falcon games will not run on the TV - the screen just scrolls truly madly and deeply. :(

The games worked fine on a SVGA monitor, but the monitor is currently bust - so I have to make do with the TV.

Any ideas of what I can do to fix this problem?

> the same number.

Hello, Guentcho... I used GEM Font v1.22 (gemfo122.lzh) to redo Monaco mono to ISO 8859-1 standards. The remapping was done manually by cutting and pasting existing characters. GEM Font has a really nice clipboard, so even individual sections (pixels) of characters can be cut and pasted. But it was still labour-intensive <g>.

As for font ID clashes, I didn't get any of those. Monaco's default ID is 273, so I just added an 8 to make it 2738 and used assign.prg to make sure things were going to get along (assign.prg does an ID check before updating the assign.sys file). If two fonts have the same ID and have the same point size, then there will be ID conflicts. At least this is what I remember from the past.

> teletext on my own TV so this would be nice to have in the computer.

I know, I have a tv card set for the P630 here but I donï¿½t want to buy a
P630 because of its limited graphics ability (maximum 832x624).

> The differences between the 5200/6200 and the 5300/6300 is only the clock
> speed of 75 and 100MHz as far as I can tell -does this really make such a
> big difference? Is there something I've missed perhaps?

Yes. The x300 have a 603e instead of a 603 (which means: double
L1-cache), 64 bit data path instead of 32 and a L2 cache of 256KB
instead of none. The maximum RAM is 64 MB (2 PS/2 slots), maximum
resolution is 832x624 (256 colours), 640x480 (32000 colours).

Please reply via EMail since this thread is very off-topic now. If you
speak German then letï¿½s go to maus.sys.mac.emu.

892. STinG Script

Newsgroup: comp.sys.atari.st
Date: 1998-04-14 00:00:00 UTC
From: Dennis Bishop <102063.112@CompuServe.COM>
Message-ID: <u$POm3#Z9GA.347@nih2naac.prod2.compuserve.com>
Source record: 103214

Below is a copy of the e-mail I've gotten from my ISP. We're
trying to get me hooked up.

Hello.

Everything seems to be ok with your script, but it looks like in the end

it's waiting for a reply of just your ip address once you log in. What we

send once you log in is in this format:

login: {username}

password:

Your IP address: {ip address}

Our IP address: {ip address}

Entering PPP mode.

PPP session from ({ip address}) to {ip address} beginning....{random ppp

garbage after this}

You might have to modify your script to look for the IP address in the

block of text that we send. Unfortunately I've never used the dialer

program you are using so I can't tell you how to do it. Try reading

through your documentation to see if you can modify the $GET_IP routine to

accept the IP in the format we have it in, or possibly there might be a

way to leave that out and have it still work. You also might want to try

using PAP, then you wouldn't have to use the login/password prompts, and

possibly not have a need for $GET_IP.

Please let us know if you get it working.

>pieces" all OK there. So I just used QED to discover that Charles and Petter
>had written back on my messages. Sorry folks, Newsie won't show them at all!
>
This definitely sounds like you don't understand "Collapse Threads".
If the Overview line contains a '+', then you can use the right arrow
on the keyboard '->' to Expand the messages, and you will see a group
of new messages with a '-' on the left side. These are Followup responses
to the original Post. Press the left arrow '<-' to Collapse the
thread again.

From NEWSIE.DOC
Article Threads are recognized. Threads are a group of related articles,
and are marked with a '+' for the primary article, and '-' for subordinate
articles. Threads formatting is dependent upon the Newsreading Preferences
'Create Threads' and 'Collapse Threads'. If 'Create Threads' is un-selected,
then Thread processing is bypassed and articles are shown in numeric
(ascending) order. If 'Create Threads' alone is selected, both the primary
('+') articles and subordinate ('-') articles will be displayed. If the
'Collapse Threads' option is selected, only the primary ('+') articles
will be displayed.
The left and right arrow keys control the expansion and/or collapse of
individual threads. Selecting a primary article and pressing the right
arrow key will display all subordinate articles for that thread. Clicking
the left arrow on the primary, or any subordinate article, will collapse
the thread back to just the primary article.

There is an option in the Newreader Preferences to turn this off if
you choose.

>Gotta check the log next time to find out what's happening here, but the docs
>are not too bright on this matter.
>The same is for the settings "max articles to fetch" and "show ... items".

>this is slightly different.

Maximum Article to Fetch is 0 to 400 with Dynamic Expansino off, or 0 to 999 with Dynamic Expansion on. It is only used for Online NewsReading. It is the maximum NEWSie will read before displaying the Overview window. If there are more to read, you must mark the existing articles as read, and then proceed to read the next maximum.

Show most recent 'n' articles with set the start article pointer to a maximum of 'n' articles. Setting this to 1000 says you want to limit any newsgroup to 1000 unread messages. Do not set this to a small number if you really want to read all of the messages. Setting this to say 100, will prevent any newsgroup from having more than 100 unread messages.

Again the purpose is to allow you to define what 'recent' means, in terms of a number of unread messages. Active newsgroups will exceed this number, since you probably cannot read the total number of messages send to that newsgroup in a single sitting.

I hope this helps,
John

Yes I do remember that problem. I think the code I installed to
prevent problems with systems without off-screen bitmap handling, may
have caused some problems with the windows being rediced in size when
they appear to exceed the current screen size.

I will check if a fullscreen window can be saved and restarted.
Perhaps I'm just off by a pixel or two.

Something happened today I don't understand. I cleaned up my hard drive system, setting my 44meg syquest to scsi 1 and my st157n to scsi0. I was able to re formatt and started moving programs from floppys back to the hard drive. I set up the auto folder as it was before and copyed flash over too. I also set up the CPX folder and put everything back as it had been. The only thing that wasn't there before was the printer, I not have a tandy 2120 hooked up to dump text files too, and yes I've got the right cable for it. Now the troubles start, when I boot flash, it doesn't seem to be working with the modem! I don't get the flashing K-sor and no echo of any commands. Could my modem port have failed? It wasn't showing anything before, it worked yesterday, but not today!? I'm going to pull the modem over to this TT to check it out.

>Are there any programs for the Falcon that eliminate hiss, snaps,
>crackles, and pops (no insult intended to the Rice Krispies people)
>that are usually found in cassettes and albums?

Actually, you can do this with a good d2d editor. As suggest Jim, zero-x
will do, as will audio-master, quincy or even studio-son (filtering and
removing crackles by hand with cut/paste etc...).
But remember all processes will be made by hand (shall i say by hear?). The
most important is the EQ quality, i mean number of filters, quality factor,
etc... and the quality of your monitors.

> I know of one such
>program on the Mac platform that I think was called DINR, but I've
>never heard of a similar program for the Falcon.

Sad to say but we do not have such powerfull automated and "intelligent"
plug-ins for Atari. Maybe with the startrack?
Bye, bye.

Source record: 103240

Hallvard Tangeraas wrote:

> Why do you want to remap your fonts?

So I can see proper foreign characters while reading the newsgroups. The newsreaders I use (NEWSie and FireNews) don't handle character remapping like Okami does.

But instead of installing Okami to do this, I've just created an ISO 8859-1 version of 10-point Monaco. Both NEWSie and FireNews are now configured to use it. The regular 10-point Monaco is still my system font, so essentially I boot with two versions (only the newsreaders use the ISO version... and only for an article's body). I have a few more characters to 'tweak' and it'll be finished. Because this took longer than expected to create, I didn't do the 8-, 9-, and 20-point versions.

If there's anyone else who sees the need for a 10-point ISO 8859-1 Monaco mono, give me a shout in e-mail and I'll send it your way.

use http://babelfish.altavista.digital.com/ to translate your
message into German, then copy and paste it into your message.

-- George Crissman
-- strads@tmisnet.com

BTW: Thanks again to the poster who gave me that AV address!

Hello!

I have the worst fears concerning the health of my passionately loved
Ataris, since he did not show such symptoms so far ever: After by the
GEM Desktop a TOS program was started and terminated, the mouse query
does not function obviously any longer correctly:

The mouse lets itself be moved still normally, but the computer
reacted only delays or not at all on Mausklicks. If I e.g. a Icon
click, nothing at all does not occur; if I move the mouse thereafter
one while, the Icon is selected suddenly (if the mouse still over it
is, otherwise mouse-clicks stop in the new place occurs).

I could limit the error already relatively, and concern makes even for
me: It is because of the mouse (with other mouse same problem), not at
ACCs / AUTO file Prgs (everything switched off), not to the HDD or to
other peripheral devices (all marked out except keyboard and monitor)
- it seems because of the computer hardware to thus be: - (

Here still my exact configuration: Atari 1040 STE, 4 MB RAM (SIMM),
TOS 2,06 (directly onboard without TOS Bridge or the like), all this
built into a Lighthouse Tower; accordingly the additions multi-board
(of the Lighthouse Towerbausatz, not any different one) and forward
led RESET key, temperature sensor and LED. I believe, war's. ICD
Hostadapter, HDD and ZIP drive were marked out. And the software does
not interest here. Oh, a virus can be it also; I neugebootet from an
eternally not used, write protected diskette (after 15 seconds.
Power-off break)...

Did someone have already a similar problem or can someone imagine,
where the error is situated? Please writes me on mailto:
sebastian.bauer@bigfoot.com

Thanks!

Ciao, Sebastian

My newsreader uses the standard atari font with converting from and
to latin-1, but i see the first capital E with an accent (the other not).
All small e have the accents (',`,^,two dots).

I thint thar for some of the encodings too much characters could go lost this way, and for them you need the aproppriate font. For Latin-1 the Atari font is good enough, for it seems that the lost characters are not widely used. (I use another Okami version, but I've read a part of the information about the version you talk about.)

Tom, Last word I'd gotten was they were closing up shop due to there's
not much money to be made in selling used Atari stuff when Atari
themselfs doesn't even make them anymore. If you need it, e-mail
me and I can lookup the e-mail address I have for them, but
I haven't gotten a new list from them in months now.

I purchased from them many times and always had a great experience.
You might try Computer Dungeon, he's been posting here often lately
now he's been able to reopen his doors.. Welcome Back.

Worth noting that MagicMac does not like virtual memory. With virtual
memory on it is agonisingly slow (on a Duo 2300), but with virtual
memory off it is slow but usable.

Lois - and Peter
Lois descrives the same kind of problems I have with newsie.
But I still use it and am shure Peter will make it work 100 % stable
in the end.

I am having the problems on my internal ide drive and the external
scsii is not affected.

I will delete my cache.dns and se what happens.

Thank you Lois for being som spesific about the problems some of us
have with newsie (why is it only some of us???)

It works, but crashes with some programs (qed). I have this too, and
I've also tried fontgdos, which is free, but has the same results.

I beleive you really need SpeedoGDOS, or even better, NVDI for the
Falcon. If only NVDI wasn't that expensive...

Nope. IDE is out of question on an STFM, unless you go throught the
difficult task of builing an adaptor board by yourself.

> Or what Hard Disks can you connect to atari's ?

Any SCSI drives, but you need a SCSI host adaptor available from any
atari dealer in the UK. Look at TUS, Titan, Systems Solutions, etc...

?? > atari font and that your newreader converts latin-1 to atari.
??
??My newsreader uses the standard atari font with converting from and
??to latin-1, but i see the first capital E with an accent (the other not).
??All small e have the accents (',`,^,two dots).

Normal?: ? exists in atari coding, but not the 3 other ones (`E, ^E
and "E). So it can't transcode them and replace by E without
accent. Informations is lost...

>>> need special fonts for mail/news.
>>
>>I thint thar for some of the encodings too much characters could go lost
>>this way, and for them you need the aproppriate font.

It depends if it try to use system font or if it can handle Speedo
2-bytes coding vectorial fonts. But as I don't use Okami, I don't know if it
can...
If so, they have all characters of latin-1 & 9, all but 2 for latin-2
and nearly all for latin-3. Can't remember for latin-8

Standard 1-byte atari coding lost half of latin-1, nearly all latin-2
and 3 (speaking of extra-chars).

> For Latin-1 the
>>Atari font is good enough, for it seems that the lost characters are not
>>widely used.

Well, it depends: missing chars are basically accentuated capital
letters.

Or you can save most of your money and buy the latest version of
Arabesque 2 Vector directly from the author. (Not to be mistaken for
the "old" Arabesque)
This is a brillant vector editing package and a bargain at just DM99.-
(about US$60). It handles EPS files better than any other Atari
program I've seen, it also imports CVG, GEM etc. of course.
Both an english and a german version is available.

The authors mail address is: J.Tochtenhagen@ndh.net

Source record: 103278

THE COMPUTER DUNGEON is proud to add more full version Shareware games
to our growing inventory.

Latest edition is "Annex" from D. Pritchard.

In this first person action game, you take on the role as commander of the
National Space Command and its your job to stop the hostile forces who have
taken over Science Station Annex on Talro Beta.

Explore the vast complex but time isn't on your side as the hostiles have
opened
the reactor cores and radiation is filling the complex.

Annex comes ready to play with printed instructions.

For more information on Annex and other full version Shareware titles (such as
Realms of Reality, Running, Mole Mayhem, Double Bobble 2000, and more)
please visit our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm

We also have many new and used ST/Falcon software titles in stock, new and
used accessories & hardware, Atari video game cartridges-systems-accessories,
and much more.

Thank You for taking the time to read this and we look forward to helping you
with all your Atari needs.

He's not the only one with this problem John. I send you an email, almost a year ago, with my prefs file, that I was having problems with saving windows positions and sizes. With some newer versions since 0.70 the problems changed a little (other windows were not saved correctly). With every new version of newsie I removed the last line from my prefs file and try to save the windows sizes and positions again. With version 0.88 I believe my only problem is with the article window reading newsarticles. I want it fullscreen and startup all the time with a window at full width but a small height (about 6 lines of text). I didn't complain about it because it is not a big problem for me to click full window once per session. And further I'm very pleased with the newsie program. I use it on a daily basis since the first public version.

Yes they did but were buggy. Methinks you've misread their docs though. appl_trecord() simply "records" mouse events whilst appl_tplay() "plays" them back - sort of a "mouse macro" in effect.

Yeah, try moving CAB.OVL and CABOVL.CFG to your MODULES folder.

Yes, it's commercial. Last version is 2.40d and 3.x is in progress. I
think there is an English version.

> characters to 'tweak' and it'll be finished. Because this took longer
> than expected to create, I didn't do the 8-, 9-, and 20-point versions.

Will you please tell what did you use to create (or remap?) the font,
and if it does work for bitmap fonts? Also I would be interested how did
you choose the font ID numbers and what happens if you load two fonts with
the same number.

Recenty I have made some bitmap fonts (iso-8859-5 and koi8-r, and some
similar, also iso-8859-1) using a utility called 2nd FontEd, they are
still in text format, and I want to convert them (with my program) to font
format and give them to more peolple. One problem is the ID problem
mentioned above. (Someone probbly will ask: why bitmap? Because my GDOS
supports only bitmap fonts.)

Bye, and thanks
Guentcho

Thanks, I've this program but I wasn't aware it could handle *EPS*. It
surely does only the version I've (v1.01c sept 27 1995) doesn't like
N.AES/MiNT. It's unusable on both my machines (TT030/Hades 060).
With Geneva or under plain TOS it works great however.

My brother has a Performa 630 and from what I've seem MagicMac is about
so fast as a TT030 running in TT high.
I must say I'm not impressed at all. Boot up a performa (at least my
brothers) takes quit some time. I haven't meassured it but it looks
like it takes 2 minutes before one finally can do something.

>Cool! It would be nicer to have everything built into the machine though.
>My brother's Performa 630 even has a remote control where he can adjust the

>teletext on my own TV so this would be nice to have in the computer.

Yep that is true but my brother can't use it because the remote
control of his tv is interfering with the Performa's one. If he turns
off the TV the Performa boots up and the other way around. Nice isn't
it.

You need a piece of hardware called LINK 97 ZIP. This is a SCSI
controler which makes possible to hook SCSI-devices on the non-SCSI
Atari's. You also need a modern Harddisk driver like HD Driver 7.5.
More info: http://members.aol.com/wbsystem

Another possibility is the ZIP ROM-PORT adaptor from Woller Systems,
Berlin.

950. CAB 2.5;STinG problems

Newsgroup: comp.sys.atari.st
Date: 1998-04-14 00:00:00 UTC
From: jondahl@mindspring.com
Message-ID: <6gubpkilh1@camel15.mindspring.com>
Source record: 103389

I'm having problems getting CAB to run with STinG. I had 2.5 working fine with STiK. Newsie was also operating properly. I switched to STing, and CAB quit working. It starts normally, except for a long delay where only the top menu displays. When I try to open a URL, I get a message," Connecting to host", but nothing happens. There is no modem activity at all. It never pings the server or tries to make the connection. The old version of CAB.OVL I used with STiK gave error messages, so I switched to 1.2805. I keep the OVL file and CABOVL.CFG in the same directory as CAB, since that arrangement worked with STiK. Newsie is working, so STinG is set up correctly. I'm running a 14 meg Falcon with TOS 4.04. Any suggestions?

>(at least from my news server).

See, I told you it could be total rubbish! You're absolutely right:
it's in *email* headers you see all the hops including dates/times.
Duh.

red face

>What about Okami... when you do a post, does Okami include the 'Date:'
>header when its editor kicks in?

Nope. Okami generates the Date header when you export the message to
the queue. Other readers like Oasis 1 and Snews which only support
NOS-format transfers write the message directly to the queue so the
headers appear in the editor.

Okami supports several transfer formats (eg NOS, SOUP, UUCP) so it
stores all outgoing messages in an internal format and generates
appropriate output files with proper headers when you run the export
utility. Sounds more cumbersome than it actually is: it just means
that it divorces the mail/news reading functions from the transport
method.

It has lots of nice features (mail sorting for multiple users - handy
for us Demonites, filtering for mailing lists, mail threading,
proper news threading - as opposed to simple subject sorting,
built-in MIME/UUE, built-in PGP interface, picture viewing for MIME
enclosures, character set conversion etc), and is highly configurable
once you get used to its methods. I found it a little quirky after
using Oasis 1 (which has more than its fair share of quirks, too) for
several years, but it's worth the initial effort.

Well, I found another copy of the script and remarked almost
everything out ... See Below:

```
----------------------------------------------------------------

#

# VAR = VALUE : standard format

#

# Lines beginning with '#' or any nonprintable character are ignored.

# They don't even consume any memory.

#

# The variable names are not case sensitive.

# Values may be case sensitive depending on usage. Watch out for

# unintentional blanks at the end of a string value.

#

# Some variables may be specified twice or more often (like the

# PHONE_NUMBER).

#

#

#

# Configuration part of script file

#

#

# This variable determines if the Dialer terminates after the last

# window has been closed. If set to zero, the Dialer terminates

# automagically after the user closed all windows. Set to one, the

# variable causes the Dialer to stay in an event loop, waiting for

# AC_OPEN or dialing request messages. AC_OPEN causes the Dialer to

# reopen the main window.
```

```
#
RESIDENT = TRUE
#
#
# Line protocol for IP packets to be used :
# 0 = SLIP
# 1 = PPP
# For CSLIP, set this to 0, and activate Van Jacobson Header
# Compression.
#
PROTOCOL = 1
#
#
# If you use PPP, your ISP might require password authentication
# via PAP (Password Authentication Protocol). If so, enter here
# the ID ("account", "user name") and the password.
#
PAP_ID = starlord
PAP_PASSWORD = xxxxxx
#
#
# Should Van Jacobson Header Compression be used ?
# FALSE = No
# TRUE = Yes
# VJHC together with PROTOCOL = 0 defines CSLIP.
#
VJHC = FALSE
#
#
# Socket to be used when Serial 2 / LAN is selected.
# FALSE = Serial (RS 232 compatible) socket
```

```
# TRUE = LAN (RS 422 compatible) socket
#
LAN_PORT = FALSE
#
#
# Your username and hostname.
#
# HOSTNAME is the hostname of your computer for this session. If
# your address is dynamically allocated, HOSTNAME will be wrong.
# For now, just set it to your providers hostname (or whatever).
# Try to make it reasonably accurate if possible.
#
# USERNAME doesn't make much sense either until I have an identd
# working. So it doesn't really matter what it is. When I do have
# an identd, this will be your `valid' username for incoming queries.
#
# FULLNAME is pretty obvious, right ?
#
USERNAME = starlord
HOSTNAME = news.ptw.com
FULLNAME = Dennis Bishop
#
#
# State here which IP address you're gonna use. If you got a permanent
# address from your ISP, put it in here. If you get a new address each
# time you log in, then use 0.0.0.0 here (this is irrelevant for SLIP,
# but essential for PPP !)
#
CLIENT_IP = 0.0.0.0
#
#
```

```
# Your ISP probably imposes a limit to the size of IP packets
# (Maximum Transfer Unit). Many ISPs use the standard Ethernet
# MTU of 1500 bytes. 576 is safe in any case, however.
#
MTU = 576
#
#
# If you want to use IP masquerading to hook your LAN to the Internet
# while your ISP provides only one IP address, set this variable to
# TRUE. Better don't touch it if you never heard of masquerading before.
#
MASQUERADE = FALSE;
#
#
# The NAMESERVER (ie: DNS or Domain Name Server) *must* be set,
# preferably to a nameserver that your provider recommends. Note :
# The address must be a dotted quad, that is, four decimal numbers
# separated by dots. The mnemonic name will not work, as again a
# name server would be needed to resolve it. Put IP addresses of
# all up to five name servers here, just preparing for the case your
# favourite name server is down. Note PPP can fetch the name server
# addresses automagically, if your ISP allows this. Still for SLIP
# the name servers *must* be specified *here* (remove the '#').
#
NAMESERVER = 207.212.176.3
#NAMESERVER = 130.75.1.40
#
#
# Port of your computer to be used for the modem connection.
# Look in the 'Miscellaneous' part of the CONFIG form for
# available choices. Spelling must be the same here. Unvalid
```

```
# names revert to Modem 1.
#
SERIALPORT = Modem 1
#
#
# Port parameters to be used for the login stage. 8N1 is used
# normally, but CompuServe requires 7E1. Setting CIX_LOGIN to
# TRUE causes the Dialer to log in using 7E1.
#
CIX_LOGIN = FALSE
#
#
# Phone Number(s). PHONE_NUMBER = number. Some providers
# have more than one number you can dial. You can specify

ABORT = NO DIALTONE
```

```
#
#
#
# Login part of script file
#
#
# This part is to log into the remote computer. This will probably
# involve entering a username and password, selecting SLIP mode,
# and reading the Internet Address that your system will have for
# the duration of the session.
#
# This variable determines how many seconds the script interpreter
# will wait for the FIND strings to be received. If the FIND times
# out, script execution will be aborted and a hangup and redial will
# be initiated.
#
FIND_TIMEOUT = 60
#
#
# The beginning of the script part is denoted by the DIAL_SCRIPT
# keyword.
#
DIAL_SCRIPT
#
#
# The STinG dialer uses the standard `conversational' method for
# login to the provider. This involves searching for certain
# words and sending an appropriate response. The special
# response $GET_IP is used to read the IP address that your
# provider has assigned you for this session. If your provider
# has allocated you a permanent IP Address, then you should set
```

```
# it using the CLIENT_IP keyword (see above) and NOT use $GET_IP.
#
# Each step of the `conversation' is specified as a FIND line,
# a REPT line, a WAIT line, and a RESP line. There can be up to
# 32 steps. Each FIND *must* have a matching REPT, RESP and WAIT,
# even if they have no value. This is because values are put into
# arrays in the order they appear.
#
# WAIT is the time in milliseconds to pause before each REPT/FIND/RESP
# For accuracy, the time should be a multiple of 5 (i.e.: a WAIT = 4
# would result in a pause of 0. WAIT = 12 would be 10).
#
# REPT specifies a string that is sent repeatedly while searching
# for the FIND string. Particularly older systems might require
# initial CRs sent, in order to trigger the login.
#
# By default each RESP line is sent with a carriage return
# character at the end. If you need to use a line feed character
# instead then put a | at the end of the line, or a \ in order to
# use an ESC character. This only works if the | or \ is the last
# character of the line. A / character at the end of a line means
# carriage return, but this is the default, so you don't need it.
#
# If you want to send just a Carriage Return, then use RESP = /
# If you want to send just a Linefeed, then use RESP = |
# If you want to send just a ESC, then use RESP = \
#
# Note that if neither REPT, FIND or RESP have a value, they are
# ignored, but in this case the WAIT (if any) will still pause.
# If FIND has no value but RESP does, the value of RESP will be
# sent immediately after the WAIT time. No REPT string will be
```

```
# sent in that case. If FIND has a value but RESP does not, then
# after the FIND the REPT repetition will cease and the dialer will
# move straight on to the next WAIT / REPT / FIND / RESP.
#
# Here is an example. Note most ISPs allow to not use any script
# at all if using PPP (PAP-ID and PAP-Password - see above - are
# used for authentication then). Therefore this example script
# is disabled. To put it to work, just remove the comments ('#')
# in front of the lines.
#
WAIT = 500
REPT = /
FIND = login:
RESP = starlord
WAIT = 500
REPT =
FIND = word:
RESP = your password
```

With this one I get past the lonin, the password, and then
I see a message in the STinG Dialer box saying ...

"Initialising Link", the modem lights flash a few times and then
I get "Link Negotiation Failed" and it shuts down then.

Sounds like it's getting to be a good program, buthow easy is it
to set up? and what's it cost? Does it or can it use STinG or STiK
(Which I don't have). I seem to be butting my head againt the internet
Atari wall.

On the 26th of April, I'll be giving CIS notice to close my account.
At that time, if I don't have this STinG working, I will NOT be online
for any e-mail. If I can't get access to the Net by next month. I might
as well as close out from the local ISP until I can afford to get some
kind of a ibm clone machine for going on the net. I am no programmer and
all of the packets I got with STinG had very little in the way of docs for
a USER, the very few where for programers. I'm out here in the High Desert
of Calif. and with no other Atari users around, so I have to rely on the
net for any help. Hach, I can't even access the ISP's text browser. I've
tried to redo the script and nothing seems to work.

I used to tell people that the Atari programs would work with just some
data pluged into them. Ha!

I got into the ISP,(maybe) and then dropped sting and ran newsie and all it
could give me was some message about failing to resuovl DNS.

And I can't find anyway to use the cab2demo I've got, it's even more
confusing.

I've been told that Zip drives are basically SCSI drives, and that the
parallel interface is an add-on in the case. Maybe it is possible to wire
out the SCSI interface ?

OK, guys, here is my little contribution to the subject:

I've own Ataris for mor than 10 years, it is IMHO one of the best designed computer systems of all times, but, as time goes by so computers, i don't own PC's, but i work with them all day long, the main reason i don't wanna buy a PC is the tech groundbreak, i've been thinking buying one just because i want APE for my Atari, anyhow, i don't think Hasbro or anyone will take the A8 out of the basquet, the many out there who own one of the newer game consoles know exactly why, in the meantime we are seeing a resurrection of old 8-bit tiltes, the last one, i think, is robotron for the N64.... So, games we will see lots of resurrections, systems, i don't think we'll see any.... Still, i buy any piece of A8 hardware that crosses my path.

Javier.

The location of offline folders shouldn't affect the windows. My
preference file is in the main NEWSIE directory, and all the other
choices listed in the preference file are being loaded correctly.

It may be (I haven't checked this for a while) that it's just one of
the windows that won't save correctly, but it's the one that I want to
change. Someone else mentioned he's having this problem.

>(I don't know about ftp client for MiNTNet)

Well I don't really want to take up everyone's time and space with
this problem again because it's been discussed in detail in the past,
but after a binary transfer there are a lot of CRC errors in the file.

Apparently it's a hardware problem on some MegaSTe's, and I can work
around it.

I can't help you with PASV, but I know there's about 3 or 4 FTP
programs (aFTP, MGFTP,.....)

You need to install Universal Font Selector in the Auto folder. It's
a nice little program that will present a font selector from within
any program "auto magically" (I love that expression).

It should be available from any FTP site. I have v1.05 - I don't know
if that's the latest.

>to this TT to check it out.

I've recently been having problems with my modem as well. After I
boot the computer, the modem returns "NO CARRIER" for the first 3 or 4
tries. After that it's fine.

This never happened before. The only recent addition to my modem
software has been Oasis which I'm using off-line, so it shouldn't be
affecting the modem port.

What machine is this happening on? Mine is a MegaSte TOS 2.05

>Falcon. If only NVDI wasn't that expensive...

As long as you only want to use bitmap fonts (which is the only thing
GDOS handles), you could always give fVDI a try. The current version (0.84)
should handle any bitmap font just fine.

Unfortunately, the current fVDI version is only really useful in monochrome
mode, since I haven't got around to writing any accelerated driver routines
for other graphics modes yet (some help would be very much appreciated!).

The version of CAB that I've tested seems to have some kind of problem
with fVDI (possibly because of the lack of justified text), but I'll try
to fix that for the next release (which will also have much faster text
output and more acceleration for colour modes).

Since my original posting of help with getting my CD-ROM drive up and going, I will explain what happens with what in the hope that someone can tell me what the hell I'm doing wrong:(

The Drive is an APPLECD 300, with a SONY 8003A mechanism.
The Atari STE's are 4 meg TOS 1.62/2.06 & 4 meg tos 1.6 (1.06).
The external hard drive is System Solutions MiniS 127meg hard drive.
Using the ICD Link II.

The hard drive has inbuilt SCSI terminator, the CD-ROM has an external passive terminator.

Now on their own both drives work OK in all versions of TOS available to me, with the exception of the cd-rom drive. I am able to read the directory of 'All things Falcon' CD and none of the 'Northern CD-ROM Series Germany' using TOS 1.62 & 1.6, in which case the ST crashes.

Using TOS 2.06 I can read ALL the directories of the cd-rom drive; I can run some programs from the Falcon CD (obviously not all of them on an STE), but when I try and run the INSTALL program on the NCS cd's the ST bombs out with a BUS ERROR (odd address).

When using the Hard drive, termination is internal. The rom drive does have the external one that came with it.

Linking/chaining them together under 1.62/1.6: As recommended by Sytem Solutions, ST - CD-ROM drive - hard drive.

The hard drive refuses to auto boot, and so floppy disk is required to boot. When booting I lose partitions of the hard drive e.g. E, F & G. The rom drive is detected and installed.

I can read the Falcon CD but again the system crashes when I try the directory of the NCS cd's. Access to the hard drive is not secure.

Changing the order to as follows: ST - hard drive - CD-ROM drive with terminator plugged into rom drive.

Again I have to boot from floppy, and the driver software displays garbage instead of the hard drive 'Quantum' type but no partitions are found. The rom drive is displayed correctly.

Accessing the CD-ROM's are identical to above under 2.06.

I don't know why the hard drive loses partitions when the rom drive is connected; this happens with all packages and drivers I have tried. Also why it crashes when reading any of the NCS cd directories in

1.62/1.6 and bombs out under 2.06 when using the NCS cd's.

I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard drive. And for the rom drive; Extendos pro, spin 34? (the latest one), metados 27. Extendos pro being the best tried.

Is there something I've missed. I'm ready for sticking my head down the toilet and flushing it, or giving myself a brain wash for short!

Any help would be more than appreciated.

Accessing the CD-ROM's are identical to above under 2.06.

I don't know why the hard drive loses partitions when the rom drive is connected; this happens with all packages and drivers I have tried. Also why it crashes when reading any of the NCS cd directories in

1.62/1.6 and bombs out under 2.06 when using the NCS cd's.

I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard drive. And for the rom drive; Extendos pro, spin 34? (the latest one), metados 27. Extendos pro being the best tried.

Is there something I've missed. I'm ready for sticking my head down the toilet and flushing it, or giving myself a brain wash for short!

Any help would be more than appreciated.

I read in the german ST-computer magazine about a small PD program
called Zip-split & Zip-rebuild. Sounds like a nice tool as it can
extract files from corrupted zip archives.
I can't find it anywhere on the internet - does anyone know if it can
be downloaded from somewhere?

Or perhaps some kind person can email it to me, it's on St-computer
PD-disk 139.

Thanks,

- Petter -

Here's what it says at the OXO System's site:

WenSuite is compatible with all machines, it works in 2, 16, 256 and TRUE COLOR, from 320 per 200 points. The JPEG unpacking takes usage of the DSP presence. It works with at least 1 Mb of RAM. The recommended configuration is 4 Mb and a hard disk (a free space of 10 Mb to 100 Mb permits a good usage of the cache).

Reference Designation Price WS-ENG WenSuite (english version)
290 FF
USA: 59.90 USD
G-B: 34.90 £
D: 99.00 DM

If you decide to 'go PC', I suggest trying Linux or
FreeBSD first. They, as unixen, tend to be a bit
harsher on newcomers but, they're much more reliable
than WinXX and perform better (more responsive) on
similar hardware. You will likely be quite shocked
with how much computing horsepower it takes to just
do basic computing with WinXX.

Unplug the external terminator on the CD Rom drive when both the HD (with internal terminator) and the CD-Rom drive are chained together... this is most probably the problem...

As for the NCS ROMs - dunno... I never got round to using them. :(

It's not the Atari that gives the problem in as much as disk access is
concerned, rather Windoze itself - NT is real finicky whereas 95 is
less so.

Stick some tape over the "high density" hole on the floppy and try formatting it 720K again. My PC is finicky about this and yours might be also. Note also that hd floppies are not very reliable so make another copy to an Atari formatted DD floppy on the STe once it's transferred.

>I have loads of
>utils for my STe (knife st etc). Can anyone tell me how to do this.
>Thank you
>Simon

You could format a DD floppy on the ST and format another 720K disk on the PC. Use Knife ST to read the bootsector off the PC formatted floppy then write it over the bootsector of the atari formatted floppy. This is a bit drastic but it is the only way I can get a reliable interchangeable disk for my STe and PC systems.

It does. It will invariably work with Windoze 95 but less often with
NT. In either case it will eventually decide it dislikes a disk and
has a tendancy to render the darn thing unreadable on the Atari at the
same time. :-(

This is exactly what I have done: rip the bootsector off a disk
formatted on my PC. Disks no longer get corrupted. I have no idea why
this works (and really don't care because it *does* work) for me.

>The only possible snag is that it (presumably) writes the same

My initial reason was to allow the ST to run AtariIRC through the PC because I don't like the PC IRC clients, but the main priority was to enable me to write STiK/STiNG software without the expense of the telephone line.

As for the Atari, the end result should have been that it was totally unaware that the PC was sat between it and the outside world.

Sadly, it seems the only way to sort out the NT "com port" config problems is to completely reinstall it. This is something I am not prepared to do. :-|

I've tried quite a few PC editors of various types and they are all
pretty naff. You might want to use one for laying out stuff in
(complex) tables but I wouldn't recommend using any of them for
anything else, especially where time is an issue. Netscape Composer is
(imo) the most bearable.

Hi Gerard!

The characters need to be converted from Atari to ISO-8859-1 before they can be used in Windows. I don't know of any program that can do this at the moment, however HTML2TXT v1.5 will be able to, if it's ever released... :-)

AIR Spectre 3.0 was the latest (and last); OS 6.02, and maybe 6.05, were working with it.

The normal BSD-telnet for MiNT/MiNTnet works fine with graphics and
colours in TosWin2.

Then youï¿½ve done something wrong :-) A P630 is /at least/ twice as fast,
most 3-4 times. Booting time is not quite relevant I think. Processor
and graphics speed is more important (for me). And donï¿½t be unfair and
test a monochrome resolution (TT) against a 256 colour resolution (Mac).
Is NVDI Mac installed?

> compatible disks -what gives????

I've lost the details now but my tests revealed that Kobold 2.5
doesn't write "MSDOSx.x" but KOBOLD into the bootsector. Windoze NT
doesn't like this. KnifeST does write MSDOS3.3 but still fails because
there were a couple of other bytes that NT didn't like (all irrelevent
I might add). I could be wrong but I just had a gut feeling that these
little inconsistencies had some relationship to each other which is
why I chose to dump a bootsector copied from "the PC" rather than just
writing a custom formatter with a fixed bootsector (which may have
only worked for me and nobody else).

> My solution is to format my disks using an MSDOS compatible formatter
> such as "Kobold" (commercial) or "Hcopy" (shareware -not supported any

Very likely. I can only think of one case where the ST might be at
fault and that is the DD mechanism is less "precise" than the HD
mechanism so "play" in the older ST drive might have an effect. This
is obviously irrelevent when both machines have a HD drive.

> (I seem to recall in a previous discussion that the desktop formatter
> did indeed follow MSDOS "rules", but that PC manufacturers didn't and
> included an extra bit of data or something in the format process...)
> Please someone -clear this up.

The only way I can get a reliable transfer is to use a DD disk
formatted on the STe which then has the bootsector from a PC formatted
disk stamped over it.

>2) In the past there was a lot of talk about disk's "serial numbers".
> (not the printed serial number on the disks, but the number used in the

> the serial number was the same).

That's it in a nutshell. Part of the Atari filing system is forever
making a Mediach() call. The purpose of this call is to discover if
removable media has been changed or not and the serial number is its
way of ascertaining this for floppies.

> Now, pre-formatted disks bought today (most of the disks bought in the
> shops these days are pre-MSDOS formatted) seem to carry the same serial
> number (I've checked several boxes with disks using one of those "serial
> number" programs -forgot which one, but can look it up), and found that

> all PCs, but many at least).
>
> When people ask in this newsgroup how to make disks readable on both the
> PC and the ST they are often told to format them on a PC -the serial
> number issue is never mentioned any longer...

To be certain, they should always be at the atari "desktop" and hit
ESC whenever a disk is inserted into the Atari. The floppy contents
should be copied straight to the hard disk or an atari formatted
floppy if the serial numbers are suspected identical. Otherwise, it
shouldn't matter.

> Does this mean that it was only a problem with older TOS versions? (in
> case, which ones?), or have people forgotten about this and it's still
> an important issue?

Just like a hard disk information such as the Fat etc is cached (yep,
you can trigger the 40 folder bug on a floppy but that's another
matter) but being removable media Tos has to write data immediately in
case you eject the thing, but having done that it knows the cache and
the floppy are "in sync" so it might as well use the cache if it can

rather than making a lengthy floppy access. This is the problem.
Insert another floppy with the same serial number and Mediach() can't
tell, thus the cache continues being used instead of being flushed.
The end result of course is that whatever was cached for the previous
floppy ends up getting written to the current floppy.

Is this a problem on older Tos versions only? I don't know. Mediach()
would need to be aware of the drive mechanism's hardware detection
line to solve it. Someone else will have to state if newer machines
are capable of this.

>3) I've mentioned this in the past but didn't find a solution for it -I
> have problems with HD disks under MagiC (version 4) !!!
> The problem occurs when formatting and/or saving data to HD disks,
> though everything works fine when reading those disks in MagiC 4.

We can only guess at the cause. It may simply be a bug in Magic4 or it
might be something much more subtle - like a timing problem with the
sync bytes at the beginning of each sector!

> All is well when using them under plain TOS (2.06 UK in my case).
> Any solutions, because obviously there's a bug -does it work better with
> newer versions of MagiC?

Daft thought. Try it with pre-emptive multitasking turned off.

I am after someone whom is willing to swap a Falcon 030 or 040 with the basics so that it can be used. I've got two 4 meg STE's I may have some other bits I could throw in with them.

I think this is called desperation; a hard disk & CD-ROM drive getting the better of me.

I think you don't need both a number in the "WAIT" field _and_ and string
in the "FIND" field. Just one or the other. For the script in question,
I would remove all the 30's in the "WAIT = 30" lines.

One other thing I am inclined to do (don't know how much difference it
makes) is include the parentheses in the last command

Guy Harrison (guy@swampdog.demon.co.uk) wrote:
:
: >PPP session from (207.212.176.17) to 209.144.118.27 beginning....~□}#@!}!}!

: RESP =$GET_IP
:
: (assuming the second IP address is "yours". If the first IP address
: happens to be yours then change to ...
:
: FIND = from

I would make that either "FIND =) to" or "FIND = from (" with the first
being far more likely to be the correct one (in the above example, it
looks like 207.212.176.17 is the IP number of the ISP's machine, and
209.144.118.27 is the IP number it is trying to assign to the STiNG user).

: I may not have this 100% right so if someone else corrects me take

I don't know if I'm any more right than Guy, but thought I'd throw in my
two cents.

Charles,

I tried CAB 2.0b and it also locked up - but CAB 1.5 displays the page
just fine!!!!

The page is a starting point for finding IRS forms - but they are only
available in the following formats:

PDF
PCL
PostScrip (no version given)

Publications and Instructions are available in SGML.

I tried downloading a W-2 form and gave up after waiting 6 minutes for
the file to start coming across the ol' wires - seems like lots of folks
have the same idea :) (7:30 pm PST - California USA)

It does here. I have a strange assortment of window positions and all are
correctly saved.

Perhaps you have redirected the location of your offline folders? I'm never
sure whether I should change files in the Newsie directory, the work
directory or the offline directory when I change things - Newsie seems to use
different folders depending on whether you're just grabbing headers or
reading for offline...

Can I take the ! meg of ram from one stf and put in as the second meg in another stf. If so how can I tell if the upgrade is successful.

1016. help zip drives and Diamond Back 3

Newsgroup: comp.sys.atari.st
Date: 1998-04-15 00:00:00 UTC
From: bdc2@po.cwru.edu
Message-ID: <6h1e9t$k4k$1@pale-rider.INS.CWRU.Edu>
Source record: 103227

I am trying to do a backup with db3 onto a zip drive. The partition I am backing up is a 200 Mb with 144 Meg of files. I am using compression. It stops after about 111 meg with a disk full message, giving a compression ratio of 62%. When I do a show info, it says only 70 some megs are there as files, but diamond edge 2 and hdroon.cpx show 100 meg used. The same partition zips into a 63 meg file using stzip. What's wrong???

Boris?

OTOH, I tried to download the www.smalldog.com (cheap mac prices) with
1.5 and it gave up - big time. 2.0b worked fine - now if we can just get
a commerical version of CAB that does what these two versions can do
separately.....

No. Well, actually it could be done, but requires a LOT of de-soldering
the little chips and piggybacking them onto the other ones, plus
changing resistors and stuff like that. You're best bet is to get a RAM
upgrade board from your local dealer.

Use a program like sysinfo to give you details of your RAM.

Cheers,
Nick

Assuming that your Zip drive is SCSI then just connect it up (make sure that
you set termination and SCSI ID as necessary)

If it's a parallel port model then it's not going to work I'm afraid.

What kind of problem ?
I've noticed that my ISP ftp-server don't accept anymore PASV. The only
ftp client available then is Fiffi.
(I don't know about ftp client for MiNTNet)

Hi Charles,

that's the nail on its head... all those Windoze box owners go just plug and pray, we only can pray...
The first night I tried to log on at my ISP (Demon) I set up the script with the details I got from them. Note, the first thing the sales dept. had already told me was "I don't believe we can handle Atari systems, sir" but anyway, I didn't manage to get through in the login procedure. Fortunately enough their support line was still open at late nite, and one clever guy told me: it's waiting for HELLO (capitalized). So I just added "wait = HELLO" and "resp = HELLO". It just did the trick...

Is TosWin2 the one with VT100 emulation? I tried an early version and
couldn't get it to run at all. Glad to know it works now, though I
stopped using MiNTnet some time ago. It would be the best/most obvious
option for someone with MiNtnet up and running in that case.

Cheers,
John

> Your IP address: {ip address}
> Our IP address: {ip address}

so the script should look like
find gin:
resp _username_

find word:
resp _password_

find dress:
resp /

now their ip address is always the same, non? and so you should have
that written down in your default.cfg, and STing should ignore this
"Our IP address:" stuff and initialize the link.
but Peter should know better!

> Entering PPP mode.
> PPP session from ({ip address}) to {ip address} beginning....{random ppp

> using PAP,

here's your clue Dennis. STing allows you to use PAP as well.
Look in the Dial.scr for this (near the end I think) and ignore the
login script. btw, is this from the stuff I sent you??

then you wouldn't have to use the login/password prompts, and
> possibly not have a need for $GET_IP.
> Please let us know if you get it working.

> Abel

> > The above is my dialer script with comments about each section.

> > shuts down the connection. My voice number is 805-256-9506.
> Anyone else able to help?
> Their e-mail is help@ptw.com

take out the $GET_IP stuff (or just make the first char. of each line #
to comment it out)
just try it like that, or go over to the PAP setup in STing (in the
dial.scr)

What do you mean by inbuilt? Does it have resistor packs or a DIP Switch?

With the CD-ROM itself you are getting bombs? Try a few music CDs -- is your
CD-ROM reader O.K.?

This would hint at either bad termination or bad cables.

Clearly your problem is not software (I am assuming that you have no other auto or acc running during your tests). I would try your hardware on another computer, for if termination really is O.K. (DON'T trust DIP switches!) and your cables really are good, it is possible to have bad circuit boards that can't handle multiple drives. Make sure your cables are good and your CD-ROM is not bad and get back to me.

Ah, but how many sectors make up a cluster on the zip?

It sounds like the backup program is not being very clever. There is
no point in it implementing compression if it is writing multiple
files onto the zip otherwise space will get wasted in the last cluster
of each file it writes. It's difficult to be specific without intimate
details of how the backup is implemented.

Personally, I prefer to use either StZip or the LZH shell for backups.
In my experience they are much more flexible and reliable than the
dedicated backup programs!

Thanks for the flowers (a very poor translation of a German sentence,
sorry).

MagiCMac *is* very slow on a 5200/6200. Of course itï¿½s faster than a
8MHz ST. But I donï¿½t want to pay a few hundred bucks to get the
double/triple speed of a ST or MegaSTE. And virtual memory was off.

Pay a only a few bucks more - and youï¿½ll get a much, much faster
machine. Thatï¿½s point I wanted to say.

> You can get it in either English or German and it's shareware and
> understand the AV protocol.

I have tried the english 1.09 version of Thing, and must say that I find
it hard to use something else now. Still, there are some things that
could be improved.

* I (maybe it's just me) find it somewhat hungry for memory.. (Maybe not
compared to Wintel-stuff, but why compare with the worst?)

* I donï¿½t know how newer versions work, but the 1.09 version doesn't
like ï¿½,ï¿½,ï¿½ (swedish letters) in filenames at all.. (although that seems
to be ok with TOS 1.62 and it's original desktop.

* Redraws are (really) not all that fast.

Those are the complaints! 8)
I still think itï¿½s the best Atari-desktop available.

/Joakim

1052. video & c questions

Newsgroup: comp.sys.atari.st
Date: 1998-04-16 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <6h641e$ip0@news.asu.edu>
Source record: 103063

I am considering a project (of no general interest) that involves using an ST connected to a composite video output device (monitor/projector).

Questions:
1) I have seen discussions here about which models output composite video. I have a video cable that connects to either a SC1224 or composite monitor, and have demonstrated to myself that my 1040ST works. While I've never tried it, I'm sure my 520STfm works. But from the discussion, it wasn't clear which other models DID work. Does the standard STf work? or must you have the Modulator version? Do you know FOR SURE - what is your basis for saying so? I would like to use a machine that has the internal floppy, which I guess is everything except the plain ST (which I know the video works!).

2) In a separate thread, people were discussing C programming. I don't have a hard drive (yet), and I was sort of waiting to get one before I started learning C on the ST. But I don't want to hold up my project until I can afford a Link II (which I could then use with my Zip, as I understand).

a. Is there a freeware/shareware C compiler that will work on a floppy-only system? How about, on a single-drive floppy-only system? Any recommendations? Sounds like Sozobon is the freeware compiler of choice, but it looks pretty big to me.
b. I've come across assembly-language tutorials; I'm sure there are C programming tutorials for the ST. Old versions of ICTARI? How about details on the system calls?

Eagle will be nice and all. However, most Atari's
still floating around now are still limited to 4M
which for GEM is nice but for Unix even in curses
mode, it's a bit cramped. That's just the RAM,
mind you, and not even getting into storage...

Yep that is what it does on my setup (N-AES1.1.7/freeMiNT
1.14.7/Thing1.20). Quit nice.
For instance: suppose I've searched for a *gif* graphic file. Double
clicking that particular graphic will open *Looknsee* (zeigsmir) and
this will display the graphic.
You see for most graphics I've assigned *Looknsee* as viewer (install
application).

Apologies if you've tried this already, but have you tried commenting out the whole of the DIAL_SCRIPT dialog section as mentioned in the comments if you're using PAP? At the moment it looks like you're still using a scripted login which may be stopping PAP from working. NB I'm guessing here but it might be worth a try if you haven't done it already.

Umm... Ebay doesn't ask any prices. It's an auction, and low prices
are set by the sellers.

Today I once more made a few changes, and now STinG makes the full connection!
The Modems CD light stays on so I know I'm connected. BUT now comes the next
road block. Do I have to have Newsie running in the background while STinG is
working? Right now I have tryed running BOTH CAB (demo2.0) and Newsie after
STinG has made it's connection, but I get nowhere at all.

1065. Newsie Log/Help Needed

Newsgroup: comp.sys.atari.st
Date: 1998-04-16 00:00:00 UTC
From: Dennis Bishop <102063.112@CompuServe.COM>
Message-ID: <#sPTShVa9GA.173@nih2naac.prod2.compuserve.com>
Source record: 103076

I am posting my Newsie log. Today I was able to make a full connection
with STinG, after it was connected I ran Newsie from Desktop and tried
the connet to host, but never got anywhere past that ... Below is my
Newsie log..

Log file opened: Thu Apr 16 08:24:14 1998

Program Path: E:\NEWSIE

NEWSie version: 0.86 Jan 03, 1998

No AVSERVER found

STiK Version: 01.08 Peter Rottengatter

Connect: news.ptw.com

open_connection returns DNS query, can't resolve hostname.

Log file closed: Thu Apr 16 08:25:40 1998

BTW, everytime I run Newsie, it shows all the pathways, which
have remained the same, does it do that all the time?

Tssss.

17 jan 98 v2.40a
-NEW HTML TABLES DISPLAY: Top results for 99% pages
-The
tag is now supported
-The anchor links are now managed again
-The pop-up menus now only opens inside the windows

29 jan 98 v2.40b
-More &xxx; HTML escape character codes added
-The <IMAGE> tag has been added (identical to <IMG> tag)
-Better handling of the editable fields in the windials & indexed dialogs
-The Newsgroups list can now be retreived again (with a warning)
-The Newsgroups list correcty updates the news window after retreiving
-The black square in the top left of the selected mono icons has been removed
-Correction of a formatting bug present if a form object is alone in a table cell
-Support of the not closed comments (due to a bug of the NetScape HTML editor)
-Better tag handling
-The spaces after a tag are now preserved
-The HTTP Accept field has been added, necessary for some servers
-No more disconnection during a HTML form edition
-More than one HTML form in a page is now permitted

05 fev 98 v2.40c
-Support of more TCP/IP connections (due to a bug of their TCP/IP layers)
-No more online access for the source display of the page

I forgot to say in my previous post that I got around the problem
by formatting the zip disk into 2 separate 50 meg partitions and then
doing 2 separate backups with diamond back. I don't like this method
though - I'd rather just do it all at once.

LH>
LH> Anyone with a suggestion? I could upgrade to 0.86, but is that a
LH> solution?

First thing wuld be to get the latest of each program, just in case features have been fixed in those.

STinG is up to v1.12, the Dialler up to v1.15 (both from Peter's site), Newsie up to v0.88 - Magic's at v5.11 (or v5.2 in Germany) but I don't think that'll matter.

Wrt Newsie in particular, before quitting out make sure you go to the menu option "Diconnect Host" as that has seemed to prevent most disk corruption I've ever had (not completely though...)

I'm convinced that there's something wrong with Newsie, such that if you just quit Newsie it leaves some open files somewhere (the LOGFILE is always one of the main culprits) but if you go to Disconnect Host then the problems don't arise. Maybe Newsie doesn't give time for the tidy up to take place or doesn't tidy up at all on exit.

p> I've now turned off all the log options in Newsie, and this seems to
p> have helped.

I'd try the Disconnect Host option as well, for safety's sake until itgets properly fixed.

c> zipdisks. At least, that is what the readme says.

I didn't know a light version of Diamond Back existed...

c> I've still not figured out how to make backups to a zipdisk with this
c> program. It looks like ezBack only wants to write to floppys.
c> Anyone who can tell me how to use ezBack with zipdisks?

With the full version of Diamond Back (v3.60 here) the first main window under Backup gives an option to select where to "Backup To:". If I click on this I get a choice to back up to SCSI tape drive, Floppy or another Hard Disk partition. Do you get that?

What version is ezBack or what date is the program file? Maybe this is one of the limitations of thelight version, but if it's advertised that it's possible to back up to a ZIP drive, then some option must be available...

Go to Joe Connor's InterActive Web site and take a look at Resource Master v2.11e - it handles colour icons and resource files.

http://www.cix.co.uk/~inactive/

The latest list I've got of his translations are as follows - all prices in ukp - he handles the cost of currency conversion himself:

```
==========================================================================
InterActive supported software scheme 20th January 1998
--------------------------------------------------------------------------
About the scheme
----------------

Since 1993 InterActive has offered a convenient way to register
non-commercial software. The scheme was launched by Joe Connor to encourage
'foreign' authors to produce and support English language versions of their
software AND to encourage UK users to register 'foreign' software.

InterActive continues to expand and currently supports over 50 non-commercial
titles and 26 different authors and over 2000 registered users. The authors
deserve your support and feedback so if you're regularly using any
unregistered software please register today - you nearly always get something
extra in return:

- Key to remove features reserved for registered users
- Local telephone, post and email support
- Free update service
- No hassle handling foreign currency
- Labelled Master disk and registration letter

Registration fees are set to cover the currency handling, stationary, media
and postage costs incurred in mailing out master disks and providing support

Although primarily a UK support scheme everyone is welcome to register via
InterActive as an alternative to registering directly with the author/s.

The currently supported software is:

Version Software Fee Status and description
--------------------------------------------------------------------------
v1.73e Kandinsky 16 [S] Vector art using GDOS/Speedo/NVDI3
```

v2.51e Kandinsky 2 30 [S] Upgrade from v1.73 costs 16 Sterling
v1.51e Two-in-One 13 [S] Archive manager, twin selector style
v4.8 GFA Flydials 13 [S] Enhanced GFA GEM routines [G]
v1.06e GFA Patch 6+ [F] GFA patchs for most interpreters/compilers
v3.6b4 Everest 11 [S] Text editor, fast and ultra compatible
v3.9i &#65533;gale 16 [S] File compare, edit and patch editor

==========

How to register from inside the UK
----
1) Use the included ORDER_FM.TXT to select the required software
2) Make sure your name and address is included and *legible*!
3) Make cheques/POs payable to InterActive for the total amount
4) Send the completed order form and payment to InterActive

Additionally from outside the UK

- Add £1 to your order total to cover postage
- Make certain payment is *in Sterling* drawn on a *UK* bank address
The following methods are known to work:
-Bank draft/cheque
-Eurocheque
-International Post Office cheque payable *in Sterling*
-Cash! Sterling, Dollars and DMs are fine -but at your own risk!

Country specific information

Canada: The Canadian Post Office can issue money orders in *Sterling*.
These are hassle free and inexpensive!
Australia: Australia Post only sell overseas money orders in US dollars
so please get a bank draft made out in Sterling drawn on a
UK bank address.
NZ: Please visit your Post Office and get a money order made out
in *Sterling*.
France: For some reason I'm getting a number of local cheques (i.e.
written in Sterling but drawn on a french bank address.
I can accept these but they cost £5 to negoiate so you must
add an extra £5 to your order total.
Europe: In general Post Office money orders or Eurocheques are the
best way to pay.
USA: What a nightmare! Can I suggest a day trip to a Canadian post
office? I've seen everything from Amex travellers cheques (add
£5 to order total), local cheques (no can do), cash (fine -but
at your own risk).
An International money order (add £5 to order total) made
out in Sterling drawn on a UK banking address is currently
the best solution, sorry! :-(

Update service

By post

To receive an update send a self addressed envelope including return postage

(or IRC) and an unlabelled double sided floppy disk. Please state clearly:

1) The software you'd like updated
2) The version you're currently using

How long will I have to wait?

Due to the number of people taking advantage of the registration service and my other commitments as editor of Atari Computing I can't always reply as quickly as I'd like to. Often I'm waiting for a new version or simply too busy earning a living so please be patient!

If you have Internet access

Visit the InterActive websites which includes news and gossip about the latest versions and downloads of all the latest versions via the web:

URL: http://www.cix.co.uk/~inactive/

If you have ftp access

Visit: ftp sofa.dartnet.co.uk
Login as 'ftp' and enter email address as password. The Atari files are all stashed in the path: /pub/atari/interactive/

Regards

Joe Connor
InterActive and editor of Atari Computing

a> Can someone please tell me where I can buy a copy of Kobold 3,
a> preferably in North America, but overseas would be OK.

The latest (only) version of Kobold that was made available in English was
v2.50 - there aren't any plans to release any more recent version AFAIK.

The latest German version is v3.50 which is probably available from ASH...

So what are you saying, George? Wizztronics now own TOS or just have a
license to develop it, like those guys on mainland Europe have?

Who's been asked to put suggestions forward? Where were they asked? What
provision has been made to build in support for protocols that have been
developed while TOS was dead and buried? What's going on?!!!!

B^{)

As much info as you can offer, please... <g>

Hi Harry,

well, you've seen I got the problem solved. THAT problem that is. Others have
told me how to handle my own mail and postings and I got that under control too.
Ya' know, I've been using a mailer system for years (Semper/LED) but this stuff
is a complete new learning process :-)

>
>You know, I've never completely understood Newsie's online messaging. I've
>never managed it successfully yet... %^{|
>
What buggers me now is I can't see my own postings back here. I saw a few ones,
but I'm pretty sure all postings of the last 2 days have somewhere gone down
the drain - at least I haven't seen them in this NG. I do it like it should be
done but heck, it just looks like Fido, where there's always The BLack Hole
lurking around...
Strange thing is: everything in Mail goes well now, but I simply miss a lot of
postings I did. So far I didn't always check after writing them (offline)
whether there were POSTxxxx files and a PBX file, but I'm gonna check this for
a while, also the logfile. Pity the logfile only exists on the last session...

In the meantime I have no further problems with Newsie, like I said, it's that
old learning process again and I do like some features, once I got them sorted
out :-)

Hello,

Does anyone know of (or have) a desktop for STE which understands the
AV-protocol and is shareware (or freeware)?
If in addition it copes with long filenames and it is not in german,
that's all the better!

Thanks,

Yves.

The N.C.S CD-ROMs have an faulty install program! It only runs on
68030 machines. There is an update/patch version that works on every
ATARI. I can mail it to you.
THIS IS NOT A FAULT OF YOUR CD-ROM DRIVE!!!

> When using the Hard drive, termination is internal. The rom drive does
> have the external one that came with it.

> Linking/chaining them together under 1.62/1.6: As recommended by Sytem
> Solutions, ST - CD-ROM drive - hard drive.
>
> Changing the order to as follows: ST - hard drive - CD-ROM drive with
> terminator plugged into rom drive.

I don't know about the termination of the LINK adapter.
Generally you have to terminate the devices at the very ends of the
SCSI cable. That means in your order the LINK has to have a
termination, the CD-ROM must not have one and the hard drive has to.
Or, if the LINK has no termination, you have to put it between the two
other devices and terminate both.
I can read the Falcon CD but again the system crashes when I try the
directory of the NCS cd's. Access to the hard drive is not secure.

> I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard
> drive. And for the rom drive; Extendos pro, spin 34? (the latest one),
> metados 27. Extendos pro being the best tried.

Try to get a newer HDDRIVER version (7.5 is actual, 7.0 is OK, too).
SPIN 0.34 is the best you can get.

Bye,
Carsten

Did you hold the [Shift] key down? According to the SMU hyp this should
result in the filepath, not the file itself being inserted.

>I remember having done this some time ago, but now it doesn't work!

In general I've noticed many AV-protocol things have stopped working here,
I've no idea why, but I dare say that upgrades of various auto folder
utilities has probably introduced some incompatibilities...

> Sounds like it's getting to be a good program, buthow easy is it
> to set up? and what's it cost? Does it or can it use STinG or STiK
> (Which I don't have). I seem to be butting my head againt the internet
> Atari wall.

It rather easy to set up, easier than STinG anyway. It does not use STiK
or STiNG, and has it's own PPP dialer. It costs 290FF, which would make
it around $60 if they took orders from the US, which I doubt. The
downlable demo version will not display graphics online.

There are still a few bugs (especially with the mail and news stuff),
although they are ironing them out progressively. The latest version is
2.40d and is available in english. It is getting pretty good actually.

Cheers,
Nick

> exists on the last session...

Make backups of your postxxxx.txt files and the post.pbx file before the articles are posted. This way if something goes wrong you can quickly start over again (this is what I used to do). But after the articles are posted (or appear to be), check NEWSie's log to see what went on with the news server. Summon the log via the drop-down menu just after doing a post. If you quit NEWSie and re-run it, the log will be zeroed. If you forgot to check the log and have already exited, view the log on your desktop.

If a post appears to be sent OK but you don't get a copy of it back, then chances are something went wrong and the log will tell you what. With server errors, NEWSie behaves as if nothing went wrong: the modem lights flicker, a prompt says it's sending, and the postxxxx.txt and post.pbx files end up deleted -- all the while the server may have rejected everything sent to it. Since being connected to the 'net, I've had four different news server errors occur, all of which NEWSie had no idea were going on at the time. But that's what the log is for.

Of course not. These piece of information is taken from their page,
English section. Perhaps you don't have the good url or use the old one
from oxo.ch

Have a look at: http://wwwusers.imaginet.fr/~oxo/
Afaik it's the official WENsuite page.

Maybe this:

There are two ways to calculate the used megs, one adding each exact
file size, the other adding each exact *cluster* used size.

Let say you've got a partition with 100 clusters, 1kB each (0.5 kB/sector).
If you store 100 files of only 1 Byte, they will fill the whole partition.

Maybe your pb is something completely different.

Do you know you can still use Led as your offline news/mail reader ?
You will need then net2net or FiST for import/export and something like
NEWSwatch/POPwatch (or even Nos) for sending/fetching. Easy, isn't it ? ;-)

Hi!

In article <MPG.f9aa1dfd64e04859896e1@news.demon.co.uk>,
gatekeeper@stonygate.demon.co.uk (Gatekeeper) writes:
> Anything else I can do? the PC appears to read the disk OK but the
> directory is empty.

MagiC PC offers you to read in complete disks as an image, either for A or
for B. Use that to use special Atari disks with MagiC PC, but this won't
help if the disks are really copy protected. It's very hard, if not
impossible, to emulate the Atari's FDC on a PC so that copy protection stuff
still works.

Ciao

I am running Windows 95 on a 486DX-66 and it runs decently. Seems almost as responsive as my Macintosh at work (7200/75). I run Microsoft Office products and have never had a complaint about performance.

I would like to try Linux but it does seem intimidating. Also, where does one get software for it (like word processing, graphic)? This is an honest question.

The GIMP is a free graphics prog, and there are others (e.g. xv, which is
shareware). The commercial StarOffice suite is available free-to-individuals
for linux: it should run under FreeBSD too. (I'm just busy trying to work
out how to tell FreeBSD that I do want it to run linux ELF binaries after
all, after answering "no" during the installation ...)

In general there's an awful lot of software available for the free OS's.

There's a free (not for profit) office suite called Star Office
available for Linux. I've got it, I use it very occasionally. I end up
using Word 97 more often because I don't get the same quality print in
Linux that I do in Windows. I'm using a Canon BJ-200ex. Printing in
Linux is primarily done with postscript, so if you have a postscript
printer you should have no problem. I, on the other hand, don't so I
have to use a postscript filter (apsfilter) to make it work with my
printer...and then I have to use a BJ-200e driver (which is half the
resolution).

StarOffice is not bad. It supports conversion of various format
documents (albeit, not Word 97, but will do Word 6.0). It has everything
you'd expect in a word processor. I especially like having the
mathematical formula editor...which comes with the package.

The major linux vendors distribute it (like Redhat or Caldera)
and you can find it in places like *linuxmall*. For games that
have been 'un'released, you can just pick up the game at CompUsa
and download the Linux version of the executable (QII, UO).

There's also a 'freeware' ST emulator called STonX that
you might want to try out. You'll have to provide ROM
images however (not hard to find on the web).

Linux will likely run more responsively on the hardware
you're using now. Although, unless you have lots of ram,
I would not expect much out of either '95 or linux.
Although Linux is a lot easier to trim and tune.

I never found the performance of M$ OSes to my liking.
I also found the registry and plug-n-pray quite annoying
as well.

>any Ideas?

Depends on whether the HD kit you are using runs a SCSI device (like the Seagate xxxxxN) or an old RLL mechanism.

Have a look in the case. If the drive in there has a 50-way ribbon connection you are GO!

Check the Seagate is set to a reasonable ID (say 0) and disable parity if this is possible on this device (very likely - Seagates are like that!). Check that the device is terminated (i.e. has the resistor packs in place near to the SCSI socket). Then just exchange the power plug and SCSI cable and switch on. Depending on what machine it was used with before it may or may not be readable by the STE but you can put this right by re-partitioning using whatever HD s/w you regularly smoke.

I have found that Seagates are easy to get running on Atari.

>I purchased a blowup FX board and I am supposed to glue a heat sink onto
>my 68030 chip. Does anyone know what glue I can use that will conduct
>heat?
>Thanks.

Hi Mike,

I recently had Nemesis installed in my Falcon by Alex at ATY, and he was a little concerned about the CPU getting warm. So, I emailed Titan/BSS (makers of Nemesis) about the heat concerns and they said:

>Well, the CPU is rattling along 50% faster so it must be expected to run
>warmer. However we've had Nemesis accelerated machines running for nearly
>a year now without a problem. Providing the fan has been repositioned, as
>recommended in our instructions, it should be fine.

Further communication with Alex:

>I just finished another Nemesis installation. This customer is a musician
>and he uses his Falcon many hours a day. It is only comforting for me to
>put a heatsink in his Falcon. I always reposition the fan to the top of
>the metal shield above the power supply for all Nemesis installation. Yet
>there is still a slight problem, the slots on the Falcon case are too
>narrow for warm air to escape efficiently. So adding a heatsink is an
>extra protection.

So I asked Alex what heat sink to get, where to get it, so that I may do this myself and he replied:

>You buy a couple of Radio Shack "Premium heat sink" stock number 276-1368,
>they are $1.49 each and you can use a very small amount of crazy glue to
>cement them onto the cpu.

So to FINALLY answer your question... apparently it's OK to use crazy glue. Isn't that kinda crazy!?! ;-) My situation dealt with Nemesis, but from what I understand it is quite similar to Blow-Up, so I think the same info would apply.

I hope that helps,

Hmm. Many people in Germany are customers of Smalldoggy because itï¿½s
cheaper - even with all the taxes and so on.

> Actually 640x480 VGA is quite nice actually! It's prefectly usable for
> viewing scanned images etc. -as I understand it, the amount of colours has
> a lot to do with the quality.

Yes. If your video mode has hi colour (32000 - 65000 colours) or true
colour (16,7 million colours) your graphics viewer can display JPEGs
without dithering - itï¿½s a bit faster. But on the other hand the
graphics speed (overall) is slower because more data has to be
transferred. On machines with fast graphics (7500, 7600, 7300 and so on)
this doesnï¿½t matter but the "slower" machines (Performas) suffer.

> >Yes. The x300 have a 603e instead of a 603 (which means: double

> I see. Sounds like that little "e" might stand for "enhanced" or something
> then.

Right, "e" for enhanced. But this matters only the L1 cache, the rest
(L2 cache, data path) depends from the mainboard design.

> >The maximum RAM is 64 MB (2 PS/2 slots), maximum

Iï¿½m referring to the Performa 6300.

> I don't agree -the subject line says "Atari on Mac" and that's what we're
> discussing. Besides, I'm sure there are others out there who are
> considering getting Macs and installing MagiCMac on them...

Okay. In the MausNet (a German network which most Atari developers use)
thereiï¿½s a group "maus.sys.mac.emu" for the MagiCMac users and so
discussing Macs is off-topic in (e.g.) maus.sys.atari.software/
.hardware.

Hi All,

Just posting to let you know that I have at the moment on EBAY
Auctionweb a variety of Video and Computer Games including Atari ST,
Ultima, and some classic handheld games.

Feel free to browse them and check out my web site for future listings.

ORIGIN : Times of Lore for Atari ST CIBU

Do you have a PREFS.INF file in your OFFLINE folder? Are the settings the
same? What I'm wondering is if the files are saed to one directory, but read
from another...

Since Tos 2.06 the atari disk format has been 100% MS-DOZE compat. Try
it on a Falcon for instance.

I think the best desktop to use would be Thing. Thing supports the full AV protocol, long filenames, is cheap to register and is just a damn fine desktop replacement.

The current english version is v1.09, althought the latest version v1.20 should be available in english soon.

You can find Thing on the Interactive WEB Site:

http://www.cix.co.uk/~inactive

Hope this helps.

Regards,

Ben Hills.

Attention to anyone with a CiX (Compulink Information Exchange) account,
this is a misleading flag and should be left set to FALSE. Peter R, would
you consider changing this flag to CIS_LOGIN or similar please??

Anyroadup...

It looks to me as tho' your script is incomplete.

If your ISP alllocates you a different address everytime you log in then you must grab this as well.

This is the continuation of my script, YMMV.

```
WAIT = 500
REPT =
FIND = word:
RESP = <password>
#
WAIT = 500
REPT =
FIND = ster>
RESP = ppp default
#
WAIT = 500
REPT =
FIND = IP address is
RESP = $GET_IP
#
```

HTH.

I think that your problem is hardware based.

Suggest that you set both HD and CDROM to provide term. power to the SCSI bus.

I'd also suggest removing the internal term. from the HD and use the external term. that you have as this will give you the best and easiest way of adding extra devices in the future.

Also check that you've set the sector size on the CDROM to 2048 as stated by Uwe earlier.

>I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard
>drive. And for the rom drive; Extendos pro, spin 34? (the latest one),
>metados 27. Extendos pro being the best tried.

Extendos Pro does seem to be able to read CDs that Spin! won't.

But that's not your immediate problem.

I have MAGCUFSL.PRG in my auto folder which calls up MagiC's own font selector when required - and no need to add a line to the magx.inf file to activate it.

Also consider dragfont.app, calling this one up allows the selection of and dragging into a window the selected font.

Scooter (a much more recent PCB design prog) certainly has plotter drivers,
the one of interest uses HPGL format.

There should be demo versions of this and Platon about, but there's the
issue of getting whatever Keith wants to print into a format that Scooter or
Platon will load.

>whether there were POSTxxxx files and a PBX file, but I'm gonna check this for

You can do that easily enough by checking in the outbox menu item.

>a while, also the logfile. Pity the logfile only exists on the last session...

Yes. I think that it might be better if the log was added to rather than
being rewritten (perhaps with a user-configurable size), would be far more
useful.

1133. HASBRO : what is the reality ?

Newsgroup: comp.sys.atari.st
Date: 1998-04-17 00:00:00 UTC
From: Godefroy <tdmilieu@wanadoo.fr>
Message-ID: <WS.35370cdc.0004a0f2.tdmilieu@wanadoo.fr>
Source record: 103002

Hello,

I am the editor of ST MAGAZINE a write an investigation about HASBRO & ATARI.
The problem is that HASBRO FRANCE says that :
- HASBRO had only buy games license
- they want only to make CENTIPEDE and other old games for PC, PSX & N64
- HASBRO do not plan to make any hardware. It's not their businness.
- they never paid 5 millions $ for this operation but they don't give the real price.

Have you official info about this operation ? Can you send me this text in my e-mail (tdmilieu@wanadoo.fr) ?

Many thanks

Godefroy de MAUPEOUnfo about this operation ? Can you send me this text in my e-mail (tdmilieu@wanadoo.fr) ?

Guy Harrison wrote:

> Ah, but how many sectors make up a cluster on the zip?

That does not depend on the ZIP but only on the partition size and the
software you partitioned your drive with.
For a a partition with 100 MByte the minimum cluster size is 4096 KByte.

1136. FS (UK): Eizo 21" monitor

Newsgroup: comp.sys.atari.st
Date: 1998-04-17 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <6h72tv$7jn$1@loki.cf.ac.uk>
Source record: 103005
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Eizo model 6500 multiscan 21 inch monitor, fst display, ecl inputs for TT hi and analog ins for graphics card, falcon, pc or mac. Beautiful image (paper white monochrome), great for DTP or midi. Max resolution is over 1600 by 1400 at 70Hz+. Condition as new, very little usage, cost a fortune.

Offers around ï¿½400.

If interested email Simon on WilliamsSG@cf.ac.uk

Either you TV is so old that it can only sync on 50Hz or the games are
made for VGA only. BTW. Some new TVs can only sync on 50Hz as well, but
handles 60Hz (NTSC) through the EURO connector. My Sony does that.

Huhu.
I couldn't wait either to get it in France and in French arround one year
ago. So I purshased the german version 2.0 directly from ASH. So goes for
the updates :/
Fiffi comes first with 2.6.

>jblenkle@calweb.com

On the Atari you would use a nifty program called ST2DISK.TTP. On a clone there's a few but lousy progs that can't handle disks over 9 sectors and 80 tracks. Mac has also some util, but that's for PPC Mac's so I haven't really tried it yet.

The Link is already terminated so should be the first item in the SCSI chain. All other devices should be unterminated with the exception of the last. All should have parity disabled (unless it's a Link II or Link '97) where it doesn't matter. Probably also best if they're all set to provide termination power to the bus as well - at least one has to be for the Link to work at all of course.

Honestly, it runs along at a nice pace! Keep in mind, I;ve used high-end
Power Macs, Suns, Pentium IIs and while it can't compare to those systems,
it runs nicely. Especially for simple tasks like Microsoft Office. I do
have 28 megs of RAM but even under 16 it wasn't bad.

> The major linux vendors distribute it (like Redhat or Caldera)
> and you can find it in places like *linuxmall*. For games that
> have been 'un'released, you can just pick up the game at CompUsa
> and download the Linux version of the executable (QII, UO).

I have seen Redhat at Electronics Boutique. The problem I might have with
Linux is that I only have a 500 meg hard drive.... Are these commercial
versions easy-to setup as, say, other major OSes? Like a nice setup
program?

>
> There's also a 'freeware' ST emulator called STonX that
> you might want to try out. You'll have to provide ROM
> images however (not hard to find on the web).

I have heard good things about it. Does it allow different resolutions
other than the three standard ST ones?

>
> Linux will likely run more responsively on the hardware
> you're using now. Although, unless you have lots of ram,
> I would not expect much out of either '95 or linux.
> Although Linux is a lot easier to trim and tune.

If by trimming and tuning I have to wade through tons of configuration
files, I am not sure I want to. Are many packages for Linux "complete" or
do you have to compile most packages yourself? Sorry I am so clueless on
Unix.

>
> I never found the performance of M$ OSes to my liking.
> I also found the registry and plug-n-pray quite annoying
> as well.

The registry is fairly easy to configure, IMHO. Also, for some odd reason
(I know I am in the minority), Plug-n-Play has worked flawlessly for me.
Windows detected all of my components and I had no conflicts. Strange ;-)

Thanks for all the responses and help!

Hello all,

I just wanted to point out that ST Informer is in a temporary spot on the web until a site host can be found locally (I am shopping around). I am using Tripod's free server space. The URL is http://members.tripod.com/~stinformer/welcome.htm. I just put a new logo on the page and would like some feedback. Thanks a lot! I am desperately seeking submissions, news, etc., so please get in touch if you want to contribute.

1147. Atari DD floppy same as IBM PS/2 floppy electrically?

Newsgroup: comp.sys.atari.st
Date: 1998-04-17 00:00:00 UTC
From: tholmbom@news.abo.fi
Message-ID: <6h7m58$bsp@aton.abo.fi>
Source record: 103016

I've been doing some work on IBM PS/2's since my Atari died and now when
I found myself a new ST I just couldn't help notice that the connector is the
same as on a Model 55SX (1990).

Will it work? And can I use it as a 1.44 after the necessary modifications
to my Atari? Or will it even work as a 720?

The connector I'm talking about is the one inside the Atari Floppy SF314.

the drive mechanism is the same between a PC and an Atari drive. The
differences are a few jumpers to set on the new drive, and the connector
is upside down, so you have to twist the cable.

It will work happily in 720K mode, but to use HD mode you need to modify
the ST. This is all in the Quick FAQ. See below.

Cheers,
Nick

Gemini is a fine desktop as well, supports very well AV-protokol, (I thinmk it actually originated it ;) and neat etc. HOWEVER GEMINI afaik is no longer supported, so, the extra things that THING supports GEMINI doesn't. Might as well register for program still supported, (especially when theyare good, and up to date)

Mac systems up to 7.0 are freely distributable. You could get them from ftp.apple.com or something like that, or from an Apple dealer, but he might charge the cost of the disks.

Your best bet would be to ask on comp.sys.mac.something.

Cheers,
Nick

MagicMac is extremely fast on my PM6100/66 (yes, a first-generation machine). The speed at which apps launch, screens redraw, and programs run is well beyond ANY Atari computer I've seen. I've got a TT030, Falcon030, MegaSTe, etc. All this speed, and 16-bit color. Very nice.

The demo of MagicMac actually compelled me to buy a Powermac a few years back. It was the only way I would have bought new hardware back then. I hated Windows. I hated MacOS. Funny thing is, that buying this product has actually weaned me off of GEM/TOS. I spend most of my time on the MacOS now. The current and past crop of Atari apps just doesn't support the latest technologies (who does image-editing and web publishing solely on an Atari machine?)

When it comes to FUN and great user experience, nothing beats firing up an actual Atari machine and loading a great Falcon demo, or old ST game. Most of these will break software emulators, however.

OK. That's the end of my frivolous ramblings.

Sanjay

>details of how the backup is implemented.

It turns out, that IS the problem. On looking closer, ICD formats a zip drive with a 2048 byte sector, and hddriver uses 4096, although it can be set to use 2048 also. As a result, all of those little 30 and 40 byte files take up 4k, even when compressed. so all the nice savings from compression wind up only saving 10-20 % instead of 40-50% of the space. DUMB!

>Personally, I prefer to use either StZip or the LZH shell for backups.
>In my experience they are much more flexible and reliable than the
>dedicated backup programs!
>
But STZIP is so damn slow! And for some reason I haven't figured out yet, lzh shell get confused and cant find some file its writing to, and dies in the middle. I don't know if its the zip drive thats causing problems, or that I haven't set it right somewhere in LZH shell.

Are you taking into account the cluster size, i beleive that DB3 works along
the reasoning that if a cluster is partly used then thats 2048 bytes out of
the game, so if you add up all the 100 odd byte files on the HD and consider
that in reallity theres 2048 bytes of Disk space used you may find the larger
figure more realistic.

Run 'nicely' is not something I would describe of
any version of Windows. They're far too bloated
for too little actual functionality. Until I switched
to Linux, I was constantly contemplating an ST
emulator so that I could run more efficient (yet
useful) applications.

That fixation is gone. (although STonX is still
kinda nifty)

Yup. Hardware configuration is more Win 3.1ish. There is
some plug-n-pray but that's primarily with PCI devices.
Whether or not this is a good thing tends to correlate
to one's Win95 experiences (good or bad). For LInux,
500 may be a bit tight. I would expect it to be tight
for Win95 as well. If you dont have any intention of
using the linux dev tools are some of the more hardcore
unix utilities (like tex) you should be fine.

Yes, but it only runs in 256 color mode.

Yes, there is configuration overhead. Unix is a system
where you boss around the OS, instead of vice-versa.

>
>>
>> I never found the performance of M$ OSes to my liking.

>The registry is fairly easy to configure, IMHO. Also, for some odd reason
>(I know I am in the minority), Plug-n-Play has worked flawlessly for me.
>Windows detected all of my components and I had no conflicts. Strange ;-)

Win95 did detect my 2nd CDROM drive, my tape drive & still
doesn't have a proper driver for it, didn't have a useful
monitor type for my monitor & misconfigured my ethernet
card disabling my modem in the process. Yes YMMV.

The registry is too prone to corruption & not a help to me
as I would be directly modifying it anyways to bend the
machine to suit me.

1166. STING - how?

Newsgroup: comp.sys.atari.st
Date: 1998-04-17 00:00:00 UTC
From: agt3@york.ac.uk
Message-ID: <6h88ka$n1p$1@pump1.york.ac.uk>
Source record: 103035

I am completely unsure how to proceed:

I have downloaded STING, and it boots up and loads modules. I can set up the modem, and configure the port set up to use 'ethernet' - i.e. the serial port, which I presume is what I need to use the modem. But what on earth do I do next? The documentation (in English) is thin to the point of being non existent.

If I try to run the dial.app it bombs out.

Can someone please help me?

thanks

Aaron Turner

Eh? Why?? You set it up to use whatever port your modem is on. Without
knowing your machine I can't predict this but it's prob. Modem 1.

>But what on
>earth do I do next? The documentation (in English) is thin to the point of
>being non existent.

You run dial.app and select Configure. Then work through the screens
setting stuff like ISP phone no., your address etc etc.

>If I try to run the dial.app it bombs out.

That could easily be because you have set it up for ethernet. Make
sure you have run SERIAL.CPX so that the port that the modem is on is
selected and set to a feasible speed i.e. 19200.

The above posting is all I could get Newsie to fetch. I never took
much notice in the past when I read postings that never finished, I
presumed that that was the entire message that was posted. I tried for
15 minutes to fetch more of the posting, at times I only got one line
and once I got the signature and nothing else!!!

I don't know what's up with Newsie just lately; postings not being
posted, eof message when accessing newsgroups after an ftp session,
Y's and N's being placed on the newgroups postings line and now
incomplete fetching of articles:(((

Getting a little depressing as I don't want to use a nightmare PC for
mail & newsgroups; the Atari's a lot less hassle. Ah such is life!!

SUBJ: Problem nach Beendigung eines TOS-Programms

Very impressive translation by Alta Vista! Pity I don't have proper Web access - seems it could save me a lot of work. Far better than RUFtrade!

Anyway, I have replied to him (in German) - sound like memory fragmentation problem to me. I occasionally get the same thing in Harlekin's text editor after I have saved a very large file a few times. It may also have something to do with not releasing memory properly.

Regards
/Peter/

r> 8859-1 I would have to cut and paste them to the proper slots.
r> Instead, I would appreciate it if you could send me your version of
r> Monaco. I purchased NVDI 3.2 legitimately, of course, so asking for
r> the font wouldn't be unethical. If you agree, Hallvard, please send
r> it my way.

If this doesn't work for some reason, do you have Harlekin? That includes a Monaco font and a font editor, which allows you to swap glyphs around and also create your own! I suspect it's only for the screen, though, not printouts.

I recently bought Magic 5 and CAB 2.5 from Systems for Tomorrow. Just wondering what kind of support(in English) is availible to me for these products here in the States? Magic has a terrible manual and I am having problems connecting with I-Connect (pretty sure has something to do with the login script). Is there an Atari friendly ISP that is availible to me here in Arizona? Is anybody working on IRC for I-Connect? I know IRC is availible for the STick/STing package, but if I can't even get something as simple as I-Connect to work right away, you know I would have a hell of a time with STick/STing. Is there any other software(shareware included) you recommend I get if I plan on cruising the web with my Atari. A novice Atarian thanks you for any feedback in advance.

Hi, I'm Ben Smith of Bravo Sierra Computers. It's called Bravo Sierra
because that's my initials. Not because I do business that way. Buyer
Beware. You can buy from a Private Party, selling out their Atari. But
where will they be when you need help. You can find bargains at a Flea
Market. Still, you get what you pay for. You can shop at a garage sale.
But where will you go when you need help. Certainly not to those fair
weather fiends. Come let me fill your Atari needs. I've been an Atarian
since 1982. I've been in my Atari Club as a Teacher of New Users, News
Letter Editor, BBS SySop, Promoter of my Club and Vice-President of my
Atari Club. So go ahead and ask your questions. And Remember, If you
can't come see me Today, Come see me Tomorrow.

FREE Catalogs for your Classic Atari 8 Bit or Atari ST Computers!
HardWare, SoftWare, Books & Accessories! I do my best to test my Atari
stock before adding it to my Catalogs. Weeding out defective stock.
View Catalogs at: http://www.teleport.com/~bensmith/bscomputers.shtml
And Jump to my FTP site linked to my Web Site so you can Download Free
Atari Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/
or if you can't get Catalogs that way, Feel free to Request my catalogs
through E-Mail. Really, it's no inconvenience. I ask that you specify
Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail
Only. Not Snail (Postal) Mail. Please let me know if I can attach files
to your E-Mail. I will get back to you after the weekend. Please Direct
all Replies Through E-Mail to: bensmith@teleport.com.

Another tip is not to delete articles when you're viewing them. This may
prevent files being left after the entry in XOVER.TXT is removed.

1184. Re: PS/2 hard drive in an STE

Newsgroup: comp.sys.atari.st
Date: 1998-04-18 00:00:00 UTC
From: David Wade <dw@netfusion.co.uk>
Message-ID: <6hauti$6u6$1@ananke.salford.ac.uk>
Source record: 102891

I doubt if you can fit a PS/2 drive into an STE unless it is a "real oldy"
MFMdrive out of a model 70.
and you can find a SCSI -> MFM converter.

Best solution is to try and get cheap SCSI drive at a computer fair. Also
watch out as many STE's
have problem DMA controllers which go flakey after about 30 mins use.

In either case you will need a host adaptor for the STE.

1185. Mint 1.14.7 and FASTRAM probes.

M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - MAKE ME AN OFFER!

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

Items : Video Master
Comments: Allows you to take color (?) snapshots from your VCR

Captures video and sound from any composite source....

If you have any questions, or your interested in one of the items
listed above, PLEASE Email me! All funds must be in US Dollars.
If you respond here, PLEASE keep the same title so that I can easily
find it.... I will ship ANYWHERE.

One final note: If you email me wanting something, make sure the return
email is good. If it's not, leave me a good email address in email!
thanks (Yes, this is in here twice on purpose <g>)

Ok, I sugesst removing the cd rom's terminator, and putting the cdrom
in between the st and the hdd. It worked for me.
(If harddrive is termanated, nothing after the drive will work
correctly.) Hope this helps,
Graham T. Cantin (Deadknight@Supernews.com)

Hello Everybody:

I'm looking to buy an Atari ST system. I don't care too much if it's a 520 or a 1040, but would prefer to pick it up from somebody here in Colorado rather than ship it. If you've got such a critter lying around, drop me a line.

Steve, from the High Mountains of Colorado

There used to be a music notation program called EZ Score Plus by Hybrid Arts for the Atari ST. Does anyone know if this program was ever ported to Mac or Pc? I liked the feel and ease of composing with notation using that program and I was wondering if it had ever been ported or if anyone who is familiar with EZ Score Plus knows of other Notation programs for Mac or PC that have a similar feel and ease of use.

Thanks for any help or suggestions.

John

I have been able to make a connection, at lest that's what STinG tells me, the trouble I'm having now is getting Newsie to connect, below is the log from my last try just a few mins ago, thing is,when I use the name the isp gave me, it gives me an DNS error as is noted, but if I put the DNS numbers there, it then just times out.

IT'S DRIVING ME NUTS!!!

The above is my latest try and getting newsie to connect. 2 things I don't understand, 1st, I'm using STinG not STiK but it records STiK? but before that it says 'No AVSERVER found' what the heck is that? and everytime I try to have newsie connect, if I have the news server as 'news.ptw.com' I get the above statement. But if I change it to 207.212.176.3 the ISP's DNS number, then it just times out and no connection.

One more week and I'll be totaly offline.

I've noticed the same problem. So I dont use the init string field (left
blank). I init the modem in the login section: send atz, then wait OK,
then the usual login script.

Bye,
/Pascal/

You're right about the MagiC manual, howver if you keep on reading and asking questions you'll pretty much figure it out.

There's plenty of extras to make your life easier around on the web, I'm sure that the authors will be along in a moment to tell you more.

>problems connecting with I-Connect (pretty sure has something to do with
>the login script). Is there an Atari friendly ISP that is availible to me

Try activating the terminal using the config. prog. When you connect with PPPConnect then you'll be able to interact with the ISP and perhaps figure out what responses you should be giving to its questions.

>here in Arizona? Is anybody working on IRC for I-Connect? I know IRC is

I'm sure I saw that there was one, but I don't have use for such.

>availible for the STick/STing package, but if I can't even get something
>as simple as I-Connect to work right away, you know I would have a hell of
>a time with STick/STing. Is there any other software(shareware included)

For the moment I think it's best to go the STinG route. There are plenty of clients available, whereas PPPConnect is for browsing only, unless you buy CAB2.6 straight from Germany and have the use of Fiffi, its mailer/ftp client. How's your German? :-))

One thing - the CAB.OVL supplied with CAB2.5 isn't suitable for use with STinG. Perhaps you'd be best getting what you have working and then use it to look around...

Ah, good idea! I've not been using one at all, and it creates problems if I ever have a bad connection and need to redial. I have to reboot, usually, before ICONNECT will work with my modem again. I'll give your idea a try. Thanks!

1211. Pagestream "Save Settings"

Newsgroup: comp.sys.atari.st
Date: 1998-04-18 00:00:00 UTC
From: Dave Gostl <dbg01@gnofn.org>
Message-ID: <Pine.GSO.3.95.980418040009.1717A-100000@sparkie.gnofn.org>
Source record: 102967

Any Pagestream 2.2SE users out there? I thought I was a Pagestream wiz until I came across this little problem. After "Save Settings" in the file menu with a 24 point Courier font selected in the font window, it just reverts to 18 point Courier next time the font window is called up. I need to create a better macro to process imported text, but this one step with the wrong fontsize is screwing me up. The only alternative is to use the mouse, which can't be recorded in a macro.

One thing that drove me nuts was trying to figure out how to
enter a [CR] Carridge Return into a macro. Its:
/N

Go figure!

Happy Festivus,
Dave

I didn't go into this because it's a CiX-specific thing - of no use
whatsoever to anyone not on the CiX conferencing system, sorry. (If there
are any CiXen who want to know more about this then you know where to mail)
:-)

>> >ftp client available then is Fiffi.

I prefer to wait for an official English package rather than fiddle-faddle
around with resource editors, Ruftrade and Look'n'See.

>Fiffi comes first with 2.6.

Updates from ASH's BBS are a strong incentive however - I don't see why
all customers shouldn't be allowed to have access.

Unfortunately Fiffi is *not* a mailer client. It's a very good ftp one
though.

This is not clear from the lack of documentation. I've now set it up to use Modem 1. Ok so far...

: You run dial.app and select Configure.

dial.app still just bombs out, even with the modem set to 19200...

I set up default.cfg and dial.scr by hand, but still no luck. Maybe it is modem.cpx conflicting with serial.cpx?

Hi Ross... Yep, its a commercial product from Germany, supported by Woller. They have an E-mail address and a Web site. I've contacted them on several occasions and while slow, they do answer (usually). I tried Visa, but they don't take credit cards, I tried COD but that fell through, so thats about that. I asked them to (please!) appoint a N.American distributor, but I've not heard anything else about this at this time. I think it was M. Grove who got a copy by having his bank directly transfer the funds to Woller's bank, then waiting for it to be sent to him (I'm thinking he said it took about a month).

It would be so nice if we could have better distribution here in the States. I know Systems For Tomorrow and Chro-Magic try very hard (and its not their fault), but right know, IMHO, things are lacking... ;(

I haven't personally installed Redhat before, but I've heard it's a good
installation. 500 meg should be plenty (I used to use Slackware and
XFree86 on a 500 meg drive and I still had room to spare).
>

As an end-user I had to reconfigure the kernal to support my hardware,
and if I wanted to connect to the internet, I had to write my own script
to connect to my provider and start the pppd daemon. There are books
that explain this, but they aren't terribly clear. Also configuring
XFree86 (the Xwindows) can be a real pain in the butt. Other than that,
that was about it. :)

There's something else you could try, Terry. I have noticed that, with some combination of s/w and modem, the modem is a bit slow auto-detecting the DTE baud rate and can miss some early characters. I have got round this in the past by setting up the init string like:

AT~~ATZ

this seems to give the modem time to settle on a DTE rate before being called upon to do something useful.

Message-ID: <3538E4EB.D68DD08A@jps.net>
Source record: 102982

Not quite exactly the same. The Nemesis only pushes the 16MHz CPU to
25MHz. FX is much more user configurable, and you can set the CPU clock
to 40MHz. The FX manual definately calls for a heat conducting paste to
seal the heat sink with. I got mine at Radio Shack, Catalog Number
276-1372, about $2.

Can anyone recommend the best PD/freeware Atari internet software for
a Falcon and where to download it.

I'm currently using my PC. My internet provider doesn't provide a SLIP
connection but the other type (something like PP or something).

I'd prefer Zips or LZH compressed files.
Acorn/Atari/Amiga/Coupe/68 Mac/PC/Spectrum/BBC/C64/MSX/SNES/N64/CPC.

You don't want both and SERIAL is, by far, the best.

Check that your auto stuff is in the right order:

HSMOD
DRVIN
MFP
STING

and that you run STING.CPX to make Sting active and SERIAL.CPX to get
the port selected properly.

Does dialer give you any message when it bombs?

> Dateifehler
> Serial-Port Modem2
> T33 Bereichfehler (Arg.)
>
>Serial.cpx says: Serial port is in use and therefore cannot be
> configurated.

To solve all this, i just put in my mint.cnf

```
[]
ren u:\dev\modem1 u:\dev\ttya
ren u:\dev\modem2 u:\dev\ttyb
ren u:\dev\serial1 u:\dev\ttyc
ren u:\dev\serial2 u:\dev\ttyd
ren u:\dev\midi u:\dev\ttye

# pour CoNnect et serial.cpx de sting
sln u:\dev\ttya u:\dev\modem1
sln u:\dev\ttyb u:\dev\modem2
sln u:\dev\ttyc u:\dev\serial1
sln u:\dev\ttyd u:\dev\serial2
[]
```

And no problems anymore with serial.cpx (from sting) or connect. No needs
for rsvx.prg or hsmodem2.xdd though.
Bye, bye.

Take my advice: Get the MiNT distribution package KGMD or TAF and
install MiNT/MiNTnet.
If you succeed in the installation you will get a far better system
then STik/STing or whatever substitute that there is available for the
moment.

KGMD or Knarf s German MiNT distribution is available on almost every
Atari ftp-site. You only need *instflpy.zoo, *basic* and the *net*
stuff. On Katherine Ellis' homepage you can find the English
installation docs together with the latest MiNT/MiNTnet stuff. Look
for KEMD_2.ZIP. I think you can find there also a link to a ftp-site
which has the full KGMD package.
http://www.primenet.com/~kellis

Apart of one of these packages you also need *gluestik*
(http://www.cs.duke.edu/~dsb/atari.html). This prg forms so to speak
the bridge between MiNTnet and STiK appications.
With Gluestik every STiK application works just fine.

The TAF or Toronta Atari Foundation (or is it Federation?) package can
also been found on every major Atari ftp-site. This package is more
suitable for machines with 4 mb or less ram.

A last final word. Don't think that Wensuite is a solution for you. I
knew lots of people (including me) who haven't succeeded to install
Wensuite properly. So it can turns out that Wensuite won't work
for you either.

If you really want a good News/Mail reader get Okami v1.33+. IMHO it's
the best offliner for now.

I have been using PAgestream 2.2SE for quite some time. It has about a half dozen "serious" problems. Font settings reverting, color setting reverting, text import problems, object attributes lacks a true transparent, screen display garbage. I have a list somewhere. I like it and use it a lot, but when something better comes along, I'll dump PS no problem. I'm having to use Migraphs Easy Draw for some stuff that PS does badly. The problems with PS are bugs that will never get fixed.

>will allow me to run my Computer Eyes that I had for my 8-bit?

I know of no program that allows this. It probably isn't even going to work
with
an emulator. It would be possible to write a program that does the SIO protocol
using the regular modem port. But remember that the resolution will be
extremely
low. Even the ST version of COmputer Eyes has very low resolution, though
Digispec helps by adding 512 colors.

1247. Can't obtain real hostname!!!!

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <353a3834164ef20@ping.be>
Source record: 102850

I've a problem of which I don't know if it is my fault or if it's the
fault of my ISP.
Since a few months I've big troubles to visite the German ftp-site
ftp.uni-kl.de. Most of the time I'm not allowed to access the site.
The problem seems to be that the site doesn't get my real hostname

```
=> user ftp
<= 530-
<= 530-Sorry, we can't obtain your real hostname, just your numeric address.
<= 530-
<= 530-There are some possible reasons for this:
<= 530-
<= 530-(1) The response of your nameserver needs a long time to get through
<= 530- to us.
<= 530- Try again now !
<= 530-(2) There's a temporary problem with your nameserver or the network.
<= 530- Try again in a few hours or days !
<= 530-(3) There's something wrong with the setup of the nameservers
<= 530- for your host, or there are no nameservers at all.
<= 530- Ask your system administrator about it !
<= 530-
<= 530---- Access denied ... see you again soon ! ---
<= 530-
<= 530 User ftp access denied.
```

My question is now. Who can be blamed here my ISP or I

BTW: It doesn't matter if I use MiNT/MiNTnet or STiNG. With both
configurations I do have the same problem.
Also it isn't the fault of aFTP as I encounter the same if I use CAB
(with ftp proxy) to visit the above mentioned site. Some other sites
are more tolerant and let my through even if they don't get my real
hostname.

```
=> user ftp
<= 220-Hello UNKNOWN at [193.121.108.68] -- No registered data,
<= 220-
<= 220-We are unable to identify your system. Please read `README.IP-REVERSAL'-
<= 220-file for possible explanation of the problem. Get it before logging in!
<= 220-IP-ADDRESS NON REVERSAL IS (usually) A PROBLEM AT *YOUR END*, CONTACT
<= 220-YOUR NETWORK ADMINISTRATION FOR CORRECTION OF THE PROBLEM!
<= 220-We can assist you, if you send a VERBATIM log of the ftp-session to
<= 220-address: `problems@nic.funet.fi'
<= 220-
<= 220-Welcome to the FUNET archive, Please login as `anonymous' with

Hello,

I just finished the installation of the MiNT distribution kit *KGMD*.
Thanks to Katherine Ellis' English docs it wasn't that difficult.
On my TT030 everthing behave like it should be but the Hades 060 seems
to have some problems with it.
For instance: I'm unable to use the virtual consoles -not that I
should make use of it- but it's very annoying that if I've pressed
[ALT F1] the keyboard is blocked. It's impossible to type anything.

BTW: I first installed the whole thing on my TT030. Then I just copied
everything on a Zipdrive (minixfs) and copied back on my Hades.
You see on both machines I'm running the same setup, N.AES 1.1.7/Thing
1.20/freeMiNT 1.14.7. I only had to edit a few files to suite the
Hades environment.

Anyone an idea about this

Since a few weeks I'm using now pppd 2.2.0f with my MiNT/MiNTnet
setup.
The problem is that when pppd is started it's complaining that it
can't find /dev/log.
Is this a bug in the executable or am I doing something wrong?

I won't repeat what others have said. What does the CDromdrive config file
say? I'm using extendDos Pro, and even though the CDrom doesn't boot up
every time I turn it on(the ICD host adapter board I think), when it does boot,
it works fine. My .INF file has my physical drive as Z, and the logical drive
as P, my last hd partition is L. If yours has a letter in the middle of your
hard drives, the driver could be replacing them.
Just my thought.

Dennis,

I tried already but my log showed "malformed header" after the msg got out so I don't know whether or not the msg's gonna show up here. I E-mailed you too, but here's yell nr 3:

I bet 10 to 1 you have exactly the same problem I encountered one week ago setting up this Train.

In short, proceed as follows: Delete Cache.dns in the Sting folder. Also replace Route.tab in the same folder by the original one from the Sting archive. Then reboot. Next check if Sting pings on your machine. First "Enable", then "Connect". When you're connected, go to Dialer Tools menu, Ping and select 127.0.0.1; when packets are returned it's OK.
Next ping your host (fill in your ISP's DNS-Server-address (NOT your own IP address).
If that's OK too (meaning the packets are returned), Sting is running OK.

Next start up Newsie (if set so in the configs, it'll hook up to your newsserver in some seconds, coming up with the Newsgroups window). If you haven't set the config so, just manually connect to host. Now, if a msg "Can't resolve hostname" turns up, your servers addresses/names are faulty.

When the msg does not turn up (I bet a thousand on this one <G>...), you're simply into business.

If you have more time, you might check the Cache.dns and Route.tab files prior to deleting them. Cache.dns is supposed to contain your server names for mail and news. If it shows german addresses, it's simply not good enough. Then just delete it. Also check Route.tab: it has plain ASCII text preceded by # characters, and one line without a # that should read:
0.0.0.0 0.0.0.0 modem1 0.0.0.0
Note: the spaces between the adresses are TABS!; not spaces really.

If however Route.tab starts with garbage mixed with readable (german) adddresses, followed by those # characters with plain text, it's just another indication Sting is messing around with its own files under "yet undefined circumstances"... (Heck, has Peter R. left the scene ;-) ???)

hey, Well I have made about 40 img picture, dithered down to 16 ST
pallete, they look great etc. The prob is that they are IMG, and are
directly useable from a desktop, such as THING or MAGICDESK.
But if you don't have such prog(the desktop), you might need to use
one of the best I could find, which was picdesk, good, not very buggy,
but ONY takes GIF, TIF, and hmm 2 other format I think), but NOT .IMG.
Also, you didn't mention your OS. (compatibility wise).

hi, /dev/log not found? hm I guess your syslogd is either not running,
or ran too fast from your /etc/rc.boot (I think).

check if it is present, with:
ps
Should tell you all the processes that are running. syslogd should be
there.
If not, run syslogd manually, and run pppd to see if it complains.
anymore prob with that, email me.

hi martin.
Yes this is totally normal.
The prob you ar seeing is:
The hades in my experience is a grafic card, vme.
The vcons are written for the hardware directly.
IF falcon, >> access the videl directly.
If TT detected, access the video of TT directly etc./
SO, basically, you need, (or someone else) to edit the screen.c and
daemon.c files from ttydev8 package to access the NOVA card you have.
Just need few registers. Recompile, and there you go, vcons on your
hades.
Vcons are GREAT tool. It is worth the effort. Maybe someone has
applied the vcons to the vme I don't know.
Bye.

Hell Dennis, if that's true it looks like String is messing with the DIAL.SCR this time... should be another newsie :-) Dial.scr is supposed to be plain ASCII...

Make sure you keep spare files of these somewhere around... and preferably far away from where Sting resides... Does Sting still login now or what?

BTW: your log in Newsie goes where your Workpath is: best is create a WORK folder in Newsie's folder.

And this sure beats me... :-)

I doubt it. Using Geneva/NeoDesk here with STinG (previously with
STiK) with no problems.

I think you should take Charles up on his setup offer.

There's a nice translation service at Altavista in case you haven't found
it. It can handle English, German, French and some other languages! And
it's free!

>hard drives, the driver could be replacing them.

My last partition is J, and extendos does ok.

Many thanks to everyone whom has helped, especially for the fixed NCS
install program.

The CD-ROM seems to work ok in every way on it's, just as the hard
drive does on it's own. The problem is as soon as I link them
together, the hard drive will not boot, and not all the partitions are
registered; and those that are the data (free space and space used)
are all up the swanny.

I have tried this using every concievable combination, including
removing the resistor packs and shortening the scsi to scsi lead.

All I can put it down to is the cable.

Now is there different wiring (pin-outs) to the 50-pin centronics
style connections?

Could someone send me the pinouts for the SCSI connection, or tell me
which 26 pins are used from the 50-pin connector and their attitude?

thanks, I'm getting there (unlike British Rail, who still got
nowhere:)))

Cheers! for now

1278. ICONNECT and CAB 2.5

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: dwmoar <dwmoar@teleport.com>
Message-ID: <353A550C.A205F@teleport.com>
Source record: 102881

Hi, Am having problems with ICONNECT (PPP) and CAB 2.5 I can boot the ICONNECT.PRG and it does tell me that I am logged on, than when I go to run the CAB 2.5 program it bombs out with 2 bombs. If however I first run CAB and than the ICONNECT.PRG, CAB does load and shows the home page than when trying to goto a URL address CAB will lock up the system forcing a reboot of the machine. Any ideas. I bought CAB 2.5 from a friend without a manual, and have read the HYP file found in the CAB and PPP folders. My system is an MegaSTe - 4 megs memory - a 28.8 modem (running at 19.2) - Link II - 1.6 Gig conner hard drive - CD-ROM - Astra Umax 1200S scanner - and a ZIP drive. The AUTO folder is as follows HdDriver / Jar10 / Geneva / Warp9_ST / Drvin / Rsdaemon / Sockets / MFP / SCC / Extendos / Outburst / UIS_III. I also have used the hsmodem program and this seems to make no difference either way.

CAB itself is on my C: partition in a folder called CAB. I am using the CAB.OVL that was on the CAB 2.5 disk.

Can you give me any suggestions on what I should try or do. Right now I log onto the ISP using a UNIX shell, but I would rather use CAB.

If this helps. If I run the ICONNECT program. It will open a dialog box that says PPP-Connect / You are online / Time / 204.202.160.76 (this changes each time I log on) / and CLOSE CONNECTION. At this point if I go to C:\CAB\PPP\TOOLS and run the GET_IP.PRG it opens a dialog box that asks for the host. I entered in MAIL.TELEPORT.COM and clicked on the Resolve button. At this point it says on the IP line "Looking Up....." From here on it just sits with the busy bee. I have to reboot the machine to get out of it

HELP HELP HELP!!!!!!!!!!!!!!! Please

Thanks David

1279. Atari ST software, cant beat this deal!

Newsgroup: comp.sys.atari.st

Since the ST went obsolete, and with the continuing advancements in computer technology, the ST seems all but a memory. Even Atari themselves are lost forever, at least the Tramiels Atari who made the ST possible are.
To keep the memory alive I'm offering ANY of the titles listed below for FREE to anyone interested, consider it a generous promotion

Just e-mail me with your requests and I'll send when I can, I expect lots of replies so please be patient.

Commercial software full programs

Epyx: Summer Games __olympic events, the original <J>
Epyx: Winter Games __ winter olympic events <J>
Epyx: The Games-Summer Edition __ more olympic events, more challenging <J>
Epxy: California Games <J>
Atari: Battlezone __ the arcade game at home <J>
Atari: Star Wars __ the arcade game, complete with voices <J/M>
Atari: Star Raiders __ excellent original space shooter game <J>
Psygnosis: Blood Money __ side scroller shooter, awesome graphics, 2 players <J>?: Ace Invaders: __ think of it as Space Invaders 2000
Tengen: Dragon Spirit __ arcade game, vertical shoot-em-up
Tengen: Xybots __ arcade games, move in 3D mazes, shoot & collect, 2 pl <J>
Sierra: Hoyle II Solitaire: dozens of solo card games <M>
?: Arkanoid-Revenge of Doh __ flashy super Breakout games, not for TOS 2+ <M>
Sega: Altered Beast __ arcade game, 2D scrolling, fight or shoot baddies <J>
?: Skyfox II, fun space shooter game
?: Strike Force Harrier __ I was never good at this sim game, want to try?
Tengen: Hard Drivin __ the polygon 3D driver <J/M/K>
Tengen: Toobin __ arcade game, scrolling down 1 or 2 players <J>
?: Kid Kong __ a clone of arcade version Donkey Kong <J>
ND: Fire! __ a side scrolling shooting helicopter, A+ graphics, fun <J>
Capcom: Street Fighter __ the original arcade game at home <J>
Sega: Super Hang-On __ arcade 3D motorcycle racing game
Namco: Pacmania __ arcade isometric view pac-man game
?: Metrocross __ side scrolling ride&jump obstacles game
Ocean: Epic __ awesome polygon 3D space shooter, lots of levels, fun <M>
Hewson: Exelon __ another space shoot-em-up
?: Skychase __ realistic sim 2-player fly&fight each other, med res.
MicroStyle: Stunt Car Racer __ like Hard Driving on a roller coaster
?: Lancaster__ Sim of WWII bomber missions, you play the gunner, 3D fun <M>
?: Indiana Jones & the Temple of Doom __ arcade version at home
?: Eliminator __ fast moving 3D racing and shooting stuff, fun
Tengen: APB __ arcade game, overhead driving police car
Antic: 3D Break-Thru __ breakout in 3-d, obviously, it's addictive <M>
?: Road Runner __ the arcade game at home, side scrolling action <J>

Psygnosis: Shadow of the Beast__ best graphics side scroller in the 80s
Ocean: Xenon __ vertical shooting space stuff game, cool graphics <J>
Innerprise: Turrican __ 2D platform, shooting, catch stuff for weapons
Titus: Galactic Conquerer __ another space shoot-em-up (deja-vu or what)
Broderbund: Shufflepuck Cafe __ addictive air-hockey game, fun <M>
Electronic Zoo: Xiphos __ 3D space shoot/sim style game, hard to play
Domark: Live and Let Die __ James Bond action/3D boat race/shooting

shareware games and playable demos of commercial games

Baby Jo __ side scrolling platform game, play a baby going home, fun
Nine Lives __ side scrolling platform game, a cat rescues his friends, fun
Saint Dragon __ awesome 2D side shooter arcade action, fun
Spellbound __ platforms and ladders romp, fun
Professor Mariarti __ challenging platform game, fun
Helter Skelter __ difficult puzzle game, bouncing balls
Big Run __ full track racing action, like Super Sprint
Zool __ like Sega's sonic-the-hedgehog, fast and hard to play
Thunderhawk __ polygon 3D heli sim, shoot-em-up
Boston Bomb Club __ addictive puzzle game, fun
Rubicon __ side scrolling shooting, one of my favorite
Armour-Geddon __ another 3D polygon, play tank-jet-heli, very fun
Medieval Chess __ chess with a twist, 2 plyrs fight when pieces meet, fun
Bugs __ awesome clone of Atari's Millipede game, fun
Robocod __ platform game with cool graphics and music
ST Vegas __ slots, black-jack, roulette, and poker
F1 __ playable demo of racing game, awesome fun
Challenge Golf __ play 4 full holes from many courses, or try driving range
Shadow of the Beast II __ harder than 1st, play a full level
Yahtzee Triple __ play classic dice game on the computer, 1-8 players
Predator 2 __ based on movie, aim crosshairs and shoot targets, 1-2 pl,fun
Back to the Future 3__ aim-the-crosshairs, now at a carnival shooting gallery
No Second Prize __ arcade game action. motorcycle racing, fast & fun
--- also many more puzzle games like Boggle, Video Poker,
--- there are lots of other demos too, send me a message and I'll see if I got it.

e-mail to LrdSercher@aol.com

David,

You should use HSModem or FastSerial, otherwise downloads and uploads of binary data will most likely be corrupted. Text data may come across OK. If PPP-Connect (am I am just guessing here as I have not used it) gives you a different address each time you log on - the program has already picked up your ISP's dyamically allocated address for that session. By running GET_IP.PRG you may, in fact, be causing great confusion. I would suggest that you not run the GET*.* and try using CAB - see if that works. A good way to see if you connection is really "live" is to enter the address of your ISP and see if you can connect to its home page.

Regards,

Steve Hammond

1281. Newsie, Everest and Pictures

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: rgc@zetnet.co.uk
Message-ID: <6hdug0ado1@irk.zetnet.co.uk>

Can anyone help please?

When I try to send a picture via e-mail, Everest corrupts the encrypted file because some lines are longer than the 300 characters allowed, and also null characters are changed.

How can I get round the problem? Do I need another text editor?

Help!

1282. Diteks DynaCADD

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: rgc@zetnet.co.uk
Message-ID: <6hdug4ado2@irk.zetnet.co.uk>
Source record: 102885

Does anyone remember a draughting package called DynaCADD from
Canadian comapny Ditek? It was distributed by Signa Publishing and
then Expressworks (I think). I am halfway thro' an engineering degree
and (having seen an old review in ST World mag) if I could get a copy
it would help enormously.

I have contacted Expressworks but they no longer deal with software,
and Ditek are still producing DynaCADD (PC only of course) bu they
have completely ignored my correspondance with them (very professional!).

Does anyone know where theres an old Atari copy I can get, or who has
a similar CAD package like Campus CAD they want to get rid of?

Thanx

1285. Positive Image

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: Neil Roughley <roughley@HORMEL.unix.dsoe.com>
Message-ID: <FN_353a76e8_roughley@news.dsoe.com>
Source record: 102888

I've just acquired a wonderful program called Positive Image v1.12 and would like to know if there are any support pages on the Web. The original owner purchased it directly from Floppyshop in England. The URL included in the read_me.doc states 'www.compdirect.com/posimage/', but that path doesn't exist.

Is there anyone else running Positive Image on a NOVA graphics card? The versions.doc file states it's NOVA-compatible:

NOVA graphic cards are automatically recognised and the
appropriate graphic card settings installed by default.
Cards compatible with the NOVA may not be automatically
recognised. In such cases you will have to install the
settings manually. They are:-

256 Colour = Byte Aligned
24-Bit = NOVA

These graphic mode settings don't work, nor do any of the others except 'VDI' mode, which is painfully slow. I'd like to upgrade Positive Image and perhaps get some compatibility feedback from another NOVA user.

1286. Still Not Working

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: Dennis Bishop <102063.112@CompuServe.COM>
Message-ID: <OHbO43Ab9GA.285@nih2naab.prod2.compuserve.com>
Source record: 102889

Well, it is about to happen. I have gotten help from many users out
there, one even set upthe program at his end using my data and even
called my ISP and he said it did just fine and everything worked.
I captured his replys and made the changes to my files.
I then deactived some of the other stuff in my auto folder.
I then re-booted. Now when I do that the modem flashs both SD & RD
until I bring STing and disconnect with it.

Guest what people..... IT STILL DOES NOT WORK.

So I am going to set everything up on my Falcon and try it on there
sometime Monday I'll light the fire and see what happens. If STinG
doesn't work then,that'll be the end of it.

Anyone else have a problem with MagiC giving the old Error -69 when trying to disconnect from their ISP? Although it doesn't happen all the time, it happens quite a bit, whether I'm using STinG or PPP-Connect.

From: cgood@cix.compulink.co.uk
Message-ID: <ErnKvs.AC3@cix.compulink.co.uk>
Source record: 102913

Newsie keeps crashing when I select 'edit nicknames'. All I get is the top window bar and an outline of the window then it crashes with error #-69. This is with MagiC on a Falcon.

This hasn't worked since v0.82 (I think?). I'm now on v0.88.

Anyone else got this problem?

Chris

> connection is made.

It looks like you input the phone number in the same dialog box as the
username/password. I don't do this either because the problem is the same
as yours. Again, I do all the stuff in the login script. Something like
this (not the exact words, depending of the language):

send text atz CR
wait for OK
send text atd ISP_phone_number CR
wait for CARRIER (or connect, depending of your modem setup)
wait for ogin:
sent user CR
wait for assword:
send password CR
finished PPP

Hope this help.

Bye,
/Pascal/

I don`t know if this is of any help at all, but here is how I have setup my
I-Conn to use with PPP.

The words in brackets are the different menus in ICONF.PRG where I had made some changes.

-- Start of file --

(Modem) Setup for PPP i I-Connect

Modem = modem2
Baud = 38400
Handshake = rts/cts
Parity = none
Data-bits = 8
Stop-bits = 1
Modem-init= atz
Esc sequens = +++_
Wait = 2 sekunder
at-command = ath0

(Setup)
Username = (your username)
Password = (your password)
Callnumber = Tone ?
Pause to retry = 30 sek.
Lokal IP adress: 0.0.0.0

(Login)
Send text = at&fx1\t90 (this is my init string)
Wait for = OK
Send text = atdt0 (my phonenumber is 0, on a special line)
Wait for =CONNECT
```

```
Wait for = Annex username:
Send user
Wait for = Annex password:
Send password
Read IP
Finish

Wait for timeout 45 sec
Script newstart 30 sec.

(Logout)
Send text = QUIT
Finish
Wait`Timeout: 5 sekunder

(DNS)
DNS IP adresse: (???.???.???.???)
Query-retryes = 4
Cache = 200 kByte

(Services)
E-mail adresse = (your e mail adress)
POP-server = (your pop server)
Username = ? (I don`t use naything here)
Password = ? (and nothing here either)
SMTP-server = (your e mail adress)
News-server = (your newsserver adress)
Time-server = ?

(Proxiex) Nothing (I do not use Proxy)?

(Sokets)
Ports

Min. assigned port = 1025
Max. assigned port = 4999
Max. baglog = 16

(PPP)
Configure retries: = 10
Timeouts: = 500 ms
Terminate retries = 2
Timeouts = 1000 ms
Max NAK = 6

(TCP)
Connection Timeout = 60 sek.
Transmission Timeout = 60 sek. Recive-window zise = 2048 bytes
Send-window limiter = 1024 bytes

(UDP)
Max. number UDP-sokets = 64
```

(IP)
Incomming Queue Timeout = 45 sek.
Type of service = 0. Precedence = 0

1302. Atari Falcon desktop pic?

Newsgroup: comp.sys.atari.st
Date: 1998-04-19 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <3539D5A8.353A@primenet.com>
Source record: 102919

Does anyone out there know a good, simple program to display a 16 color desktop pic and also a 256 color pic, depending on which mode I am using, on my Atari Falcon? I remember combing around for one a year back or so and becoming disenchanted with everything I found for some reason. I am at a busier point in my life now than I have been and don't have as much idle time to hunt around, and would appreciate any advice about a good, no-nonsense program. I am tired of having an ugly one color backdrop. Also any advice on where to find 16 color pics that look good would be appreciated also, that is 16 color pics that use the default palette. I tried using that cool old ST dragon pic a while back, but it is all shades of red and brown and therefore so were all the icons. :P -Satcom2

Try deleting CACHE.DNS from the folder of STiNG modules. When STiNG
is re-booted it will set up a new one. I had this fault many versions
ago and provoking a new CACHE fixed it.

No worries - STiNG pretends to be 'STiK' so that it does not confuse
programs looking for STiK's presence.

but before that it says 'No AVSERVER found' what the heck is
>that?

Again, don't worry. STiNG does not need an AVSERVER to function
although a few more things become possible if you have an operating
system and desktop which DO support it.

and everytime I try to have newsie connect, if I have the
>news server as 'news.ptw.com' I get the above statement. But if I
>change it to 207.212.176.3 the ISP's DNS number, then it just times
>out and no connection.

Have you tried the 'PING' function available from the tools menu in
the dialer? After getting a connection try to 'Resolve' your news
server then try to 'Ping' it to verify that packets are getting
through. I think this is all in the docs.

Anyone interested in buying the following mags from me?

ST Review Magazines
With Disks (without - 33)
5, 7, 7, 21, 26, 27, 28, 29, 30, 30, 31, 32, 34, 35

ST User
Ranging from Volume 1 issue 1, to the last but one issue October 94.
Around 72 mags in total, including all cover disks where applicable.

I am contemplating selling my full sets of ST Applications, ST Revieww
and ST Formats - dunno yet - but make me a good offer and they will
probably be yours. ;)

Collection from Essex, London or manchester - otherwise a hefty
postage charge.

Regards
Danny

No, don't have that option :^(

> What version is ezBack or what date is the program file? Maybe this is one
> of the limitations of thelight version, but if it's advertised that it's
> possible to back up to a ZIP drive, then some option must be available...

(I'm talking about ezBack v1.00.) Well, I think you are right about that
it is one of the limitations. As I allready was afraid of that, I
secretly hoped that it was posible anyway.
Still I wonder why ezBack is in the ZipJazTool-pakage as you can only
use it to backup FROM your zipdisk and not TO (as they suggest in the
readme). It doesn't make the pakage more usefull.

I saw the ZipJaz Tools for sale once and I can't remember the exact
price, but I it was about the same price as CAB2.5. And actually it's
only interresting for people working under TOS with a Zipdrive and
AHDI: The ZipTools itself offer the same extra's as HDDriver does
(regarding Zipdrives), like using passwords, remote eject, formatting
etc. The bonus utillities don't work under MagiC (a floppy-formatting
and a file-search tool) and together with ezBack they offer not much
interresting for zipdrives. Is there anyone who wants to pay so much
for this? Now I understand why I got it for free with my Zipdrive... ;^)

OK, thanks Harry. I think I'l have to look out for a decent backup
program then.

Karsten

>every single time in MagiC after a sample has been played).

Yes "Graftool" is a nice prg indeed and it may be faster but I
don't like the way it's messing around with the desktop colours.
Sometimes the menu items are barely visible. With Look'n See it's also
possible to load a graphic prg if one wise to edit the picture one is
looking at.

Have you tried N_Player? This shareware prg recognise SAM,
DVS, SND/AU, WAV, AV. It runs as acc and prg, it supports Drag & Drop,
is MultiTOS compatible etc...
On my TT030 I've assigned this prg instead of *GEMJING* to play wav's
from inside CAB. I can't use it on my Hades because it requires DMA
sound which isn't implemented in the Hades.

>
>By the way, do you know if "Parafin" is available in English?

AFAIK, there isn't an English version available.

1325. ST-Falcon Full Version Shareware Games

Newsgroup: comp.sys.atari.st
Date: 1998-04-20 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998042019244200.PAA08320@ladder03.news.aol.com>
Source record: 102694

THE COMPUTER DUNGEON is proud to make available full versions of many top quality Shareware games for the Atari ST and Falcon.

We have over 20 titles in our library, including Running, Double Bobble 2000, Realms of Reality, Annex, Mole Mayhem, Trader 2, TeknoBall, Curse of Azriel, and many, many more.

Our website has online descriptions and screenshots of all our Shareware titles.

Please visit us at: http://www.mcs.net/~isis/dungeon/dungeon.htm

With almost no new commercial gaming releases, Shareware has become more and more important. Your purchase of Shareware gaming titles from The Computer Dungeon not only guarantees that the authors will receive payment for their work, but also give incentive for Shareware authors to continue to release new titles for the ST and Falcon.

PLEASE take a look at our offering of full version Shareware titles and help support the Shareware system by purchasing a title or two.

Without the hard work and dedication of Shareware authors, we Atari users might find we may have nothing to run on our computers.

Thank You for taking the time to read this and we look forward to helping you with all your Atari needs.

I have heard of some users having this problem, but am unable to
duplicate it here. Therefore there is no change.

I you can give me some details, it may help.
I am running Magic, so you therefore should be viewing the Edit
Nacknames via the WDialog (in a window).
Do you have a NICKNAMES.TXT file in your Mail folder?
How many Nicknames to you have defined (>10)?
How many email addresess do you have for the largest Nickname (>20)?

I am usure how to proceed when I cannot duplicate the problem.
Can you send me a copy of your NICKNAME.TXT file via email?

Hi Ian!

I once wrote a program in GFA-Basic that allowed different users with
different profiles (with a simple password check, nothing really secure).
I never published nor documented it, but I thought for myself to take it
up once more.

If there is more interest in such a program (should run on ANY ATARI),
please let me know.

Greetings,
Carsten

Hi everyone ....

..... this coming Saturday, April 25th, is a WAG Meet day.
WAG - Wessex Atari Group.

If you fancy coming along to the meet (everyone is more than welcome!)
then come along !!

Details are on www.users.zetnet.co.uk/rgoring/wag

Hopefully we'll see you there !!!

Felice (Maggie Team)

Version 2... wonderful. I've just visited the address you posted. I'll
let them know they have a new owner (me) and also ask about graphics card
compatibilities. Thanks for the link.

I tried all the different graphic mode settings, including Crazy Dots. At least you see a palette -- all I get is horizontal lines (including the mode specific to 24-bit NOVA). But at least it works in VDI mode (the little squares), so I know what the program can do (or parts of it).

I really like its masking and 'floating' image capabilities (more advanced than Cranach's). The manual is very good, too. And I was very surprised to see PNG support, the format I use for archiving scans (normally converted through GrafTool).

1345. CURRENT NOTES - Macintosh PD disks

Newsgroup: comp.sys.atari.st
Date: 1998-04-20 00:00:00 UTC
From: gwestndrf@aol.com
Message-ID: <1998042023224901.TAA08815@ladder01.news.aol.com>
Source record: 102714

Does anyone know of a source for the Macintosh PD disks that used to be available from CURRENT NOTES?

I would like to get some of these disks for my recently acquired Spectre GCR cartridge.

Thanks,
Gail Westendorf

>Hi, Am having problems with ICONNECT (PPP) and CAB 2.5 I can boot
>the ICONNECT.PRG and it does tell me that I am logged on, than when I go
>

I'm using ICONNECT and CAB 2.5 without any problems. From your posting I'm not exactly sure what you are doing so I apologise if I suggest something that you already know.

You need to the ICONF.PRG to create a dial-in script for your ISP and then run ICONNECT and click on CONNECT to run the script. Once this connects you should be able to run CAB without any problems.

>if I go to C:\CAB\PPP\TOOLS and run the GET_IP.PRG it opens a dialog box
>that asks for the host. I entered in MAIL.TELEPORT.COM and clicked on
>the Resolve button. At this point it says on the IP line "Looking
>Up....." From here on it just sits with the busy bee. I have to reboot
>the machine to get out of it

I don't know why you need to run this, I thought it was called automatically by ICONNECT.

I hope some of this helps,

Yours,
David James

In case you haven't heard, Windows 98 crashed during Bill Gates demo of it at the Spring Comdex today! An assistant was trying to hook up a scanner to the USB (which sounds a lot like the old 8-bit SIO daisy-chain!) when it crashed to a blue screen. After roars of laughter, Gates only comment was: "I guess that's why we're not shipping Windows 98 yet!". I'll bet there's an opening for a USB programmer at Microsoft tomorrow! :)

MSNBC has an on-line video clip of it.

You think so ? Then it's good that I won't tell you that V2.7 is very close
to be released. :-X

ASH admits that they got a problem with international distribution of their
software. Sounds as if they're looking for other solutions, but I can't
really tell if they're actively working on it.

If so, you should not make it look like a software problem, but instead
install the corrected GAL, like described in the HSMODEM dokumentation.

> This morning I replaced it by v 0.86, but the same thing happens.

Quite funny as Terry May reported the same thing. ROUTE.TAB is read by
STinG exactly once, that is while it is executed from the AUTO folder.
NEWSie has no business with this file, it shouldn't even know that it
exists. It does not look like accidental disk corruption either, because
for both you and Terry it effects ROUTE.TAB (not a more or less random
place on the disk), and only the first part of it is effected (a corrupted
sector on the disk would trash a larger part, at least 512 bytes).

If this is reproducable consistently, you should try to isolate which
action within NEWSie causes the damage. Start with an intact ROUTE.TAB.
Start up NEWSie. If you got multitasking, view ROUTE.TAB over and over
again while doing various actions with NEWSie. Without multitasking, you
need to leave NEWSie each time of course.

Looks ok; are you sure that DRVIN is the first one from the HSMODEM package ?
The other parts must load after DRVIN, but still before STinG of course.

> Wdialog is somewhere run

Make sure you have a *very* late version. Some bad bugs have been corrected
just recently.

> and I'm using the Liberty library needed for
> Freedom.

Ouch ! Well I guess the illegal things Freedom does do not hurt with your
setup, but ... ;-)

> BTW: my new E-mail adress is louis@holleman.demon.nl but Newsie should be
> working fine first before you can use it :-(

NEWSie is not the only package capable of handling e-mail. In fact there
are four or five for STinG ! Choose from Infitra, POPwatch, Antmail, etc.

Run Ronald Andersson's Time client from the Dialer's login batch. This
ensures that you'll always have your system clock set correctly, even
daylight saving can be set automatically; as the current time is fetched
from the Internet whenever you log in.

The "Time Services" package can be downloaded from my web page.

Then it's indeed corrupted. CACHE.DNS is a binary, not human-readable
format.

> To make a long story short: When the original Cache.dns sits in Stings folder,
> the DNS cache seems to be loaded OK, but then Sting itself won't ping at all!

A resolve problem, possibly ? Maybe the RESOLVE.STX gets corrupted too ?

> Furthermore I seized TelSTar from a site, but Telstar won't even connect,
> saying it can't resolve hostname.

See my theory above.

> Apart from that, Newsie is screwing me up on E-mails (receive is OK, but
> sending is a disaster), just the news goes OK.

Seems to me, you should avoid NEWSie for the moment, and reinstall all
STinG parts apart from the DIAL.SCR file.

> Maybe I'll have to pick up ol' Antmail, huh?

Try Infitra. Don't have the URL ATM, I suggest you ask some search machine
like Altavista (http://www.altavista.digital.com).

Don't use the Ethernet driver because

- the one in the package is not functional (a working one will be in the
next release).

- I doubt that you have any ethernet hardware in your machine (Have you ?)

- you use a modem as you told, which got nothing to do with Ethernet.

> serial port, which I presume is what I need to use the modem. But what on
> earth do I do next? The documentation (in English) is thin to the point of
> being non existent.

Dunno what you want, if you consider 104 kB of compressed dokumentation
"thin to the point of being non existent" !

I guess it's the README.1ST what you call thin ? If you only had read that
thin bit ! You surely won't have missed the lines

: To gain a first impression, use ST-Guide (can be found on
: my web page) to display STING.HYP, which forms some sort of preliminary
: documentation.

would you ?

Had made me think that some other program reconfigures the port after
the Serial.CPX had configured it at bootup, if, well, if you hadn't
posted your detailed setup. ;-)

> AUTO folder programs found at C:\AUTO*.PRG
>
> REDIRECT.PRG Graphics card
> MAGXBOOT.PRG I refuse to boot without it <g>
> XBOOT.PRG Boot selector
> NVDI.PRG NVDI ET4000
> SLCT_DEV.PRG Resolution setter

These should not hurt anyway, as they are executed before Zcontrol.

> The result in SERIAL CPX was to report Modem 1 @ 9600baud B^{<

Sounds as if you had not saved the wanted serial configuration after
your modified setup ?

Unfortunately, under certain circumstances HSMODEM shuffles the bios
numbers of the serial ports if the HSMODEM modules are loaded in a
different configuration. Recalling from memory, I'm not sure if I
already built a workaround for this into the CPX. So after setting up
your minimal configuration, you'd need to set *and save* your serial
configuration in the CPX, then reboot and check.

Sorry for not having pointed that out in my first reply.

> I think I should just be grateful and keep my mouth shut.

No. Problems are there so that they can be solved. Lets do it.

Actually there has been another report on a similar problem, so maybe
it's a consistent bug ? If we come to that conclusion, I'd need to send
you a special debug version. Will take a little time though, because
since I'm moving, my presence here diminished a fair bit ;-)

> References: <2864_hsideras@mettav.demon.co.R.E.M.O.V.E.T.O.R.

It's obvious that "E.P.L.Y.uk (Harry Sideras)" is missing, which destroys
all the news threading. Have you possibly set your editor to auto-reformat
your text ? Header lines that are long must not be wrapped !!!

John, I think NEWSie should be modified to include certain NEWS header tags
after the message has been edited. This should especially include the
Reference line, as there is no reason why a user should be allowed to edit
it.

That's probably because you have missed the fact that STING.HYP is the doc file (the only at the moment). Why you missed it ? Well, probably because you thoroughly ignored what "The few docs I got with STing cover", i.e. how to read that file.

So grab a copy of ST-Guide, which should be with every modern Atari anyway. Available from every ftp or BBS site that carries Atari stuff, or my web page.

The HYP file is far from complete, but it has lots of valuable information and a frequently asked questions collection.

PR> Quite funny as Terry May reported the same thing. ROUTE.TAB is read
PR> by STinG exactly once, that is while it is executed from the AUTO
PR> folder. NEWSie has no business with this file, it shouldn't even
PR> know that it exists.

Actually, Peter, I recommended setting ROUTE.TAB to read-only because I've had _similar_ problems, but not the same exact problem. In my case, I was losing NEWSIE.PRG and BINARIES.GRP. They were not getting corrupted, but they were actually getting erased. There may have been others, but I'm pretty sure I never had a problem with ROUTE.TAB.

I don't use NEWSie anymore, but I was using 0.86 and 0.88 for awhile (for online news reading only), and I didn't have the problem with those two versions.

p> Ahh.. Come on Terry, You know I mean megabytes and Gigabytes. 8-)

Sorry, I was just giving you a hard time. :^)

AFAIK, there's no limit on the capacity of drive you can use. Theoretically, you might not be able to use all available space, but at 1 GB per partition (might be 2 GB now) and partitions available at least up to the letter P (more with MagiC), that's not going to happen, especially with 2.5" drive

Hallo ComDungeon, I saw you wrote:

C> Does anyone know what the dip switch settings should be on a Megafile
C> 30 to make it Unit 0?

I can only tell you what worked for me when I had those noise beasts.

switch 1 2 3 gives unit
on on on 0
on off off 1
off on off 2
off off on 3

I hope this little table is clear, eg switch 1,2 and 3 on gives unit 0.
hopes it works for you as well.

moi (dutch dialect for see you), carel

HT> "UFSL cookie not installed, used internal font selector?"
HT> "[Internal] [Cancel]"

Here's the catch...
QED can only use the universal fontselector (UFSL) or the extended universal
fontselector(XFSL) as provided by HuGo or Calvino; both are TSR's.

THING however provides its fontselector via the so called 'Font-Protocol' by
Christian Grunenberg.

The first is a programming interface, the latter is sort of an extended
system-call.

Hi:

I want to set up my STacy to check my e-mail, I have a USR 14,400 modem and an Internet account that requires PPP. What programs are recomended by you Atari users out there? how do you set them up? I need english instructions please.

If you reply by e-mail please sent to davisent@perf.bc.ca

Thanks for your help,

Stephen Davis

*** MUST SELL THESE MAGAZINES TO GOOD HOME! SEE BELOW! ***

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly. Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President trevor@cyberspc.mb.ca

1390. FS: SyQuest 88 MB SCSI removable hard disk system + carts REDUCED

Newsgroup: comp.sys.atari.st
Date: 1998-04-20 00:00:00 UTC
From: Trevor Cordes <trevor@cyberspc.mb.ca>
Message-ID: <893031935.41C6@cyberspc.mb.ca>
Source record: 102799
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,misc.forsale.computers.mac-specific.misc

SyQuest 88 megabyte removable hard disk system with 6 (or 7) cartridges.
Drive is in perfect condition and all carts have NO bad sectors and are
in perfect condition too. Rarely used - only used for monthly backups.
This drive can also read 44 MB cartridges. This drive is SCSI.

Comes with 14 day guarentee to be free from defects.

Bare drive with 6 carts for only $249.

Bare drive with 1 cart for only $99.

Carts separately only $38/each.

Possibly available is an external case made just for this drive.
Most likely $20 _with_ purchase of the above drive.

You need to UUencode or MIME the picutre files. Newsie does this when you
select the file as an attachment. Don't try to load the picture file into
your text editor, it should be sent as an attachment, not the body text of
the e-mail message.

Ditek is alive and well -- you can contact them via their website at:

http://www.ditek.com/

I've been using their Atari version of DynaCADD professionally in my
Architectural practice since the late 80's. Its an excellent piece of
software that was developed on the Atari platform.

The newer Windows version is greatly enhanced and has even more features.
I believe Ditek's website also has reprints of magazine reviews of their
software in head-to-head comparisions with AutoCad. Enjoy.

Sheldon

Re: "I-Connect ?'s", pricard@club-internet.fr scribbled the following on 19 Apr 98 @ 11:23:14:

p> send text atz CR
p> wait for OK
p> send text atd ISP_phone_number CR
p> wait for CARRIER (or connect, depending of your modem setup)
p> wait for ogin:
p> sent user CR
p> wait for assword:
p> send password CR
p> finished PPP

Aha! This works! I omitted the ogin/assword part, because I don't need a logon script, but the rest works. It has the added benefit of allowing me to look for "CONNECT 5" to ensure that I get at least a 50k connect. (I hate not knowing what kind of connect rate I got.)

Many thanks!

p> I don`t know if this is of any help at all, but here is how I have
p> setup my I-Conn to use with PPP.
p>
p> [...]
p>
p> Modem-init= atz

Thanks, but I've had no problem with any part of I-Conn except the Modem-init. The "atz" doesn't work for me, because I-Conn doesn't see the "OK" coming back from the modem. I now have a workaround, using a script, but it still baffles me why I can't use a Modem-init string.

<vroom> The Falcon has a DB15 port on the back in which one can plug
either of two adapters, one for a VGA monitor and one for an Atari color
or mono monitor. That's what the original poster meant by "VGA module".

1402. SoftPC on a Hard Disk?

Newsgroup: comp.sys.atari.st
Date: 1998-04-20 00:00:00 UTC
From: csh@agate.net
Message-ID: <6heihr$1or$1@usenet47.supernews.com>
Source record: 102811

Just for fun today I tried to get the SoftPC that came with the Bird of Prey CD-ROM working on my Falcon. I was gonna see if I could get an old version of Quicken running.

I managed to eventually get it to boot from an old IBM DOS 3.30 diskette I found at work, got an A:> prompt, did some "dir"s, but that's as far as I got. It doesn't seem to like 1.44 meg formatted disks, and piece of junk Windows doesn't want to format HD diskettes at 720k, so I'm having trouble transfering an .exe to see if anything will run.

Anyway, I'd like to be able to run off the hard drive, since it doesn't really look like its made to run off floppies, but how do you do it? The docs are painfully sparse.

It looks like you have a file on the hard drive that acts as your "c:" drive, but how do you create this file so that SoftPC will recognize it? The translated "docs" mention using the DOS Format command, but that didn't do anything. Whenever I typed c:, d:, or e:, it said 'unrecognized drive letter"

Has anybody gotten this to work off a hard disk? What steps am I missing? And will using DOS v5 allow 1.44 floppy access, or is that a limitation of SoftPC?

Any help greatly appreciated.

thanks,

No, there is no number assigned to the host adaptor (it isn't a SCSI device), except that the clock on AdSCSI+ hosts gets an ID of 6.

Falcon and TTs have a true SCSI port and can have an ID set as well.

>it's 6 for ICD systems, but I'm not certain

I might put mine up for sale. TOS 3.06/ INT SCSI 340mb Maxtor/ HD
Floppy. AIXIT fast ram card with 20mb of fast ram (can take 64mb/2-72
pin simms)/4mb ST Ram. The ALT key needs to be replaced (I can probably
handle that) but my mouse got caught in a trap:). I'd send an Atari mouse,
but you have to acknowledge that they are trash in the first place and
not complain that the mouse didn't work:). I have an owners
manual too. No free/commercial software included. It will boot to the
desktop with AHDI.
If your not in a hurry, make me an offer. If I don't reply, it was to
low:).

HDDRIVER uses the smallest cluster size possible except when you switch
on TOS 1.0x compatibility. In this case (also depending on the partition
size) clusters have to be larger.

Has anyone of you tried Adamas? It's still in early development but it's
looking very good and it can handle animated GIFs correctly which CAB
can't. Maybe it can handle this as well. :-)

Not exactly true. Earlier TOS versions (upto 1.4(?)) (mis-)used LINE-F in
the AES part to squeeze a few bytes out of it. But this was as internal
as you can get, and you won't find any docs about that.

Floppyshop has a new web site at
http://www.floppyshop.cyberstrider.org and they have a section
dedicated to Positive Image.

The new one is Positive Image 2, ; I'd like
to see it myself, as they made a number of major changes (including
making it modular using Parx' freeware module files). Still no demo
files on the web site.....

Eh? What? Never had this prob.

I assume you use Newsie's 'Attach' facility and choose either UUE or
MIME as the coding? Both of these coders give standard 80 char lines.

>The problem seems to be that the site doesn't get my real hostname

This is a sort of security mechanism used by quite a few ftp sites now... the problem is at your ISP

According to the checks I have made, there is no reverse DNS for your host - and checking the NNTP-Posting host you are posting from, there is no name attached to it.. thus the same problem, no reverse DNS.

Your ISP will have to fix this problem...

Regards
Danny

1424. MagX login program?

Newsgroup: comp.sys.atari.st

I use an old version of Navigator dor Mac with Specter 3.0; or sometimes
just a plain old terminal program such as STorm. But the latter works
with fewer and fewer forums nowadays.

It's really only idleness that keeps me from cancelling my Compuserve
"membership".

I can't think of any way in which this could be your fault, the problem is at your ISPs name servers, I suspect (3) is the most likely, your ISP has not configured thier system properly to allow reverse lookups, you should contact them ASAP and ask them to fix it.

p> Lucky man.

Yeah, most of my connects are 53.3k anyway (the max), but occasionally I'll get one in the 40s, and that's usually an indication that line noise will follow, so I'd rather cut out those types of connections right from the get go. The script allows me to do that.

Actually, they're less than 80 (UUE much less), but the point is, they do
give consistant line lengths shorter than 80 columns. I'm guessing he tried
to load a pic straight into his text editor.

I really don't like the actual program version because it's really too
slow when displaying pictures ... by building it with little squares.
And also, the program contains some Crazy Dots graphic card options
which don't work at all ... when you select one of these buttons you
receive wrong palette in both cases ...
Lot of work for the autor.

Hello,

I was told, that there are some screensavers around asking for a login
when you want to start typing again. Which one is equipped with that
feature?

It should run on a TT with TTM 194 and MagiC 5.2.

Regards,

Kerstin

Twist 3 was never released by Hisoft, but I run an
English Twist 3 supplied by Indigo 2 in Denmark
(Twist was programmed by a Danish programmer).
Twist 3 has also been released in Germany by
Maxon.

I´m not sure if Twist 3 is available any longer,
the version I have is dated May 1995. The program
works fine, and I use it every day!

If you need more info concerning Twist 3, I´ll try
tofind some info.

Hi Peter,

Good lawd, this was already :-) a week ago....

I recall sorting out when this happened: NOT when starting up Sting (or the dialer that must be), but I recall AS SOON AS I activated Newsie (so Newsie made a connection with the host!) and then quitting again after logging off, I had this corrupted file. NOTE: also Cache.dns seemed to go corrupt, though I never checked it completely. Heck yes, now I recall: Cache.dns got parts of Route.tab in it (lotsa comment lines starting with #). The funny part is, when I set both files to "read-only" the corruption went simply on... Can U explain that???

So I think something went completely wrong in Sting's trying to write the names for the servers into the Cache.dns. And in turn this ONLY COULD HAPPEN after Newsie hooked on to the server.
And again, once the original Cache.dns was deleted, Sting managed to write this file (with the right names) OK without corrupting Route.tab at the same time.

Peter, I believe Petter Toneff wrote back he had a similar problem and he as well believed it was Newsie screwing up. Personally I don't think Newsie is to blame, the problem is: as long as you cannot reproduce this on your own machine, you're getting nowhere... (maybe try installing Liberty/Freedom temporarily to find out if these are the bad ones...?)

BTW, I just went to your site and picked up the latest Coretools, Modules and Dialer. My evening is filled again... :-)))

I'll just see if I can find time enough to give the whole process a re-run, so installing the original Cache.dns again and see what happens then.

Will keep you posted,

1442. Newsies malformed headers

Newsgroup: comp.sys.atari.st
Date: 1998-04-21 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <893182806.27153.0.spot.c3adfca1@news.demon.nl>
Source record: 102652

Hi all, and especially John Rojewski!

Remember I've been writing about these postings going down the drain? Finding the log said "malformed header"? Well, GOTCHA, I've got it all saved here and the 1 million dollar question is: What's going on here???

My last reply to Peter Rottengatter: I read the msg, an do a follow-up on it. Here follows the lines from the POST0000.TXT that was created afterwards:

Newsgroups: comp.sys.atari.st
From: louis@holleman.demon.nl (Louis Holleman)
Organization: demon.nl
References: <892214671.29464.0.rover.c3adfca1@news.demon.nl>
<ErpFy9.K5n@suse.modem.stud.uni-hannover.de>
Subject: Re: Newsie screwing up?
X-Newsreader: NEWSie Version 0.88 (Atari)

Next, I hook up with Newsie to get the msg off, here's what the log tells:

200 news.demon.nl NewsBorg [rover]
-> mode reader
200 news.demon.nl NewsBorg [rover]
-> post
340 send article
441 malformed header "<ErpFy9.K5n@suse.modem.stud.uni-hannover.de>"
-> group comp.sys.atari.st

So the posting goes down the drain, I don't see it back later in the NG.

Next I do a new posting, pasting parts of Peter's message into the editor (QED) and keeping the same subject name. Here's the headers of that msg:

Newsgroups: comp.sys.atari.st
From: louis@holleman.demon.nl (Louis Holleman)
Organization: demon.nl
Subject: Re: Newsie screwing up?
X-Newsreader: NEWSie Version 0.88 (Atari)

Next, I hook up with Newsie again to send it off, and the log says:

Log file opened: Tue Apr 21 19:37:56 1998
Program Path: C:\NEWSIE
NEWSie version: 0.88 Feb 27, 1998
WDIALOG supported
AVSERVER is: THING
STiK Version: 01.06 Peter Rottengatter
Connect: news.demon.nl

```
200 news.demon.nl NewsBorg [spot]
-> mode reader
200 news.demon.nl NewsBorg [spot]
-> post
340 send article
240 ok
-> group comp.sys.atari.st
```

On my next hookup to my host it came in like it should.

Anyone with similar problems??? Funny part this time is that it won't always happen... I did a follow up on someone asking about Soft-PC this morning that went off perfectly. But the earlier answer to yet another message from Peter R. this morning got nowhere either...

Questions, questions, questions.... will this guy never stop???

Looking forward to some explanations :-)

I suspect the "malformed header" error has something to do with the header references. The next time you do a follow-up, keep an eye out for how long the references line is and how it's formatted. That is, if it's so long that it scrolls off your editor's screen, then go to the very end of the line and make sure nothing is truncated. Some editors have limits on how long a line can be (STeno, for instance, had problems). You might find that follow-ups to a busy thread (i.e. lots of references on one line) is the source of the problem. Obviously this post (yours) was sent OK, but I noticed you had to do a *new* post (no references line was present). Whether your references line is too long or improperly formatted, I would keep my eye on it to see if a pattern exists (my money would be on improperly formatted). For posts that "don't make it", view the manual backups you made of them -- check spacing, line-ends, truncation, or anything else that a news server might be finicky about.

Hi Neil,

you simply GOT it! I know my QED is set to break lines at 80 chars. So I just
turned that off, now I've got to put returns in on the lines, but let's see
if this goes OK now.
I remember seeing this reference line on two lines in that posting I did
before, where I put in those headers from the "follow up postings"...

OK, this also means I have to keep an eye on my own lines of writing, don't
go beyond 80 chars.

Tks for the advice,

Yes under plainTOS I can read the CD but there are lots of files (Mint
stuff) which can't be read at all (0 bytes). Strange enough I could
read it at the time I was using N.AES 1.1.0 but as soon as I had make
the update I couldn't read the CD anymore.
It isn't only me who has experience this kind of trouble. I've seem
other posting about this.

Probes with Thing? That's something new for me. Did you install the
whoel stuff properly?

From: louis@holleman.demon.nl
Message-ID: <893194434.27110.0.rover.c3adfca1@news.demon.nl>
Source record: 102664

Hi all,

good lawd again, one problem gets solved, the other one turns up.
(Yep, I know you all think "what now, sucker?"

So I got the latest stuff from Peter's site, put it all in (except for my DIAL.SCR, DIAL.INF). Everything else (Sting.prg, the tools, the STX modules as well as Dial.app and the RSC file) has been replaced.

Dialer now tells me I'm on version 1.15 for both Sting and the Dialer.

Guess what: my transfer rates go back to something like 200-250 cps (that's with Newsie fetching articles) whereas these used to be at least 1000 cps or more... (this on a 14K4 modem).

So I'm simply going back to the old version, till this has been sorted out.

My bills are high enough as they are already...

I hardly don't dare asking: what did I do wrong this time???

Put a space or tab here to separate the message IDs. Also make sure
each references line ends in a hard return (your first one doesn't).
Better yet, temporarily turn qed's line formatting mode off and then
bring all the message IDs onto one line, each separated by a space,
with the last entry ending in a hard return. This way if NEWSie or
FireNews users do a follow-up, there'll be no need for the dreaded
references 'rebuild'.

FireNews makes this inelegant 'rebuild' process easier by quoting the
source article's entire header, so one doesn't have to search around
for it like in NEWSie.

It could also be that one of the boards (either on the CD-ROM or on the HD) is
too weak to allow combining the cables. It doesn't happen often, but I've
found at least one confirmed case of "refuse to work with anyone else".

I disconnected my SCSI chain and installed another drive into the middle of
it. Now nothing works. Fun.

Under one of the menus is "Drive D". Choosing this allows you to create a
virtual partition (acually, it's a file) for your IBM C Drive. This can then
be formatted and set to auto-boot as normal in DOS.

Also, shared partitions (Drive E on the DOS side) now works, thanks to various
Atarians here (Thanks Boris!). Prove that you have DOS 3.3 and I will send
you a ZIPped disk all ready to go (will save you some work).

1465. help with drive problems

Newsgroup: comp.sys.atari.st
Date: 1998-04-21 00:00:00 UTC
From: nstewart@ican.net
Message-ID: <nstewart-2104981950230001@news.ican.net>
Source record: 102675
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

My 520fm is unable to access disks. The drive is getting power and is doing a little bit of work to find the disk. Always I get: "Drive A: is not reponding. Please check the disk drive, and insert a disk..."
A couple weeks ago, I bought an SF354 drive without any connection or power cables. I open up the Atari and put this drive in the place of the other one...same problem.
I can't even format a disk on the Atari!

Any insight you could give me would be greatly appreciated.

I have done ALL of that so many times I think I can run it in my sleep!

It seems to be that STinG can not or Will Not work with this ISP's setup,

they use CHAP, a 'Kind' of PAP. I've tryed to use the CIS script, but the
phoneline to the CIS node is so bad I don't even get a connection 3/4th
the time.

So, until STinG can handle CHAP, I'll be OFFLINE as of Friday Night PDT.

I didn't even care about getting on the WWW, I was aiming for the Newsgroups
as my #1 mainstay. Looks like I'll be paying $35 for nothing.

|Which address did you enter ?
|
|Does anybody know if CompuServe uses private IP addresses, and what services
|they allow to go through ?

Peter,

Compuserve uses dynamic addresses (if that's what you mean). I can also ping CIS's host(s), and do just about anything that can be done with a dedicated ISP except for email... the 'oldmail' ASCII email system cannot be used with POP :(and that you need to log in with 7 bit instead of 8, A problem fixed very nicely by some guy named Peter (thanks Peter <G>).

I use CIS for browsing, UseNet, and email on some of my other accounts with very few problems.

If there's anything specific you're interested in about the workings of CIS as an ISP, just let me know how to find what you're looking for and I'll get it to you fast.

Take care,

No, it means that one of the paths listed doesn't exist. Best thing to do
would be to select each path in turn to see which one is wrong. Once you've
found it, either select a new path, or create the folder for it.

It does sound familiar. I had that problem with v0.84 and the solution was
to copy the NICKNAME.TXT file into the MAIL folder. Once it was there, no
more problems.

1478. Newbie question about TOS 2.6 and 800k disks

Newsgroup: comp.sys.atari.st
Date: 1998-04-21 00:00:00 UTC
From: Larry Silverman <larrysilv@earthlink.net>
Message-ID: <01bd6ccb98797720ef512499@default>
Source record: 102762

I have some new STE user questions for the group:

1. Is there anyway to run those compacted game disks on a 2.06 STE. Every time I try the two that I have, the ST seft-test seems to prevent them from loading. On PacifiST, I could get them to run if I switched to TOS 1.02.

2. How do I uncompact 800k .ST disk images?. I use the MSDOS converter, but it has problems with any image above 720k.

Thanks for your help. I'm sure these are dumb questions, but I couldn't find the answers in the FAQ.

No it doesn't need to be terminated, as it's a buffered DMA port. I
have used it that way for years with no problems - and also with the
out port connected via a Link II to another SCSI drive (because my
'box' didn't have a SCSI out socket). No problems either way.
I think yuou'll find the card described in the ICD-published AdSCSI ST
booklet.

MF> same here - unless I can find a cure, I'll have to find a new
MF> backup program - does a comparable one exist?

I wonder whether the problem isn't mainly due to Zip running out of space
to produce its temporary files while compressing. Try an uncompressed
backup first. If this works, then perhaps you'll have to compress
batches of files or folders individually in manageable sizes.

I notice that when trying to post to groups such as
xxx.xxxxxxxx.xxxxxxxx.xxxxxxx.xxxxxx, that Newsie dosen't insert the
proper newsgroup, so I assume posting to one with that length of a
name is not possible. The last bit of the group is lost, and some
random characters are inserted.

>Cheers Peter

I'm kind of interested why some users are having problems with the Newsie files. I run Newsie from an EZ 135 cart, seperate from everything else. The only time Newsie has given me disk problems is if I try to delete or otherwise mess with a file that Newsie is either using, or wrote (temp file?). Maybe a good test would be for them to move Newsie to it's own partition, without any other files present, and not play around with the contents while Newsie is active. After a long session, I always run Correct by the EZ cart to see if any damage has occured to the disk. Kobold, if used to try to copy some files that Newsie is using while active, will report that the file is locked and won't copy it (most of the time). It's not a simple solution if you don't have a removable disk, or an extra partition, but I haven't had any disk problems at all.

Is there anyone but Prisolo Oy in Finland that sells Atari equipment in the
Nordic/Scandinavian area. I'm just curious to see if I can get hold of an
Falcon VGA adapter and a couple of Mice at a cheaper price.
Or does anyone in that region happen to have an adapter and/or some
mice, and perhaps an RGB display for a Mega 2ST at hand?

Regards, K. Hampf

The LINK96/97 host adapters also have an ID which is hardcoded to 7.
That's the reason why these adapters are required in order to use drives
like some Quantum Fireball models with the ST/STE. Host adapters that
don't supply such an ID don't recognize these drives.

Yes, you're wrong. This is a per partition limit, not a limit that
applies to the drive's capacity. Each partition can have up to 1 GByte.
DOS compatible partitions can have up to 2 GBytes. The drive's capacity
is unlimited. The same also applies to SCSI drives. There is no upper
limit.

The truncation is caused by NEWSie's 50-character limit on message IDs.
FireNews doesn't have this limit, but like NEWSie it only uses the
references from the *first* line, so some manual interaction in an editor
has to be done to 'fix' things. But FireNews does one thing differently:
it quotes all the article's headers when the editor is summoned, so
instead of digging around trying to reconstruct things, the complete
references are already there (ready for pasting).

A few of the older games didn't work on the STE with TOS 1.62, let alone
with 2.06. The main culprit is those boot sector copy protection
schemes.

> 2. How do I uncompact 800k .ST disk images?. I use the MSDOS converter,
> but it has problems with any image above 720k.

there are programs floating around that conver .ST files to disk or to
.MSA files, then .MSA to disk. You are not talking about pirate software
now, are you ?

Cheers,
Nick

I don't know about you but I find it very annoying when poeple don't state their country when posting "For sale" and "Wanted" items.
There are probably a lot of people like me who wish to keep things simple and cheap by only dealing with people in their own country with respect to these type of postings.
If you could just add your country of residence in brackets at the end of (or anywhere in) the subject line this would stop people like myself from wasting time reading messages from countries that we are not prepared to deal with.

Hi Peter (and glad you're back here)

First of, it had nothing to do with the earlier versions of Newsie. I started out with 0.82, then I got 0.86 and a little later I grabbed 0.88 from John's site. With all versions the problem existed. It wasn't after I installed 0.88 when I found out (thanks to the FAQ and the hyp) that these two files Cache.dns and Route.tab got screwed as soon as Newsie was hooked into the system. At first I thought Newsie was the problem, but later (and I still tend to hang on to this theory now) I figured out it isn't Newsie. Let's sum it up here:
Sting reads a file Route.tab for the routing. It also reads Cache.dns for the server's names, right? You provide a Cache.dns with (probably) your own used names. So Sting starts, finds addresses and a routing table and says: OK, let's do it. So far so good, Sting pings fine.
Next I start up Newsie, but Newsie says: hey man, those addresses are wrong, they should be "whatever". Newsie works OK, and in the meantime or just later, I don't know, Sting wants to write the new addresses into Cache.dns but fails to do so, instead it corrupts the Route.tab and the Cache.dns. After that it simply won't ping any longer to the host. So you have to reboot and if you haven't found out about the corruption, it finds no decent route any longer and won't ping any longer.
Like I said, simply deleting Cache.dns did solve the problem: first Sting displays "Cache load failed" but what the h..., next Newsie passes the right names to Sting for the Cache.dns, Sting writes a decent file and doesn't screw up Route.tab in the meantime. This problem turned up here and AFAIK with other people too, but not with just anybody... It's probably depending on what's in your system. I have been thinking of Liberty/Freedom straight from the

beginning, that's why I mentioned it in my set-up.
Right now this stuff runs decently for about a week, I admit I had to learn once again how to handle new programs :-) but I've come to grips with them and I have no longer big problems. Only problems left are sometimes Newsie screwing me with postings and E-mail, so right now I'm steadily checking the log whether things go right or wrong.
I still believe it's best for just anybody NOT to put the Cache.dns in Sting's folder at the start, because Sting will write the file itself once it's got the right names for it. Therefore I once more ask: delete this file from the archives... it MAY prevent lotsa problems.

I will visit your site soon and get the latest stuff for Sting etc.

Finally, I know you call Freedom a "Schweineprogramm", it may be one, but the rotten thing is: Freedom is my replacement to Selectric and I simply won't let it go easily... I got simply hooked to it... :-) It really must screw me up on a permanent basis before I throw it back into the can!

BTW: again, this posting went down the drain, it was sent off but the log showed "malformed header" so I think it got nowhere. For this I make copies of the POSTxxxx and POST.PBX files, so now I just send it again by simply creating a NEW posting, trying to keep up with the thread and pasting in the POSTxxxx file into this new msg in my editor. That works. I figure Newsie sometimes cant't handle the given address, hence the "malformed header" message.
This is the final bug that's bothering me with Newsie, and it might originate from this Freedom/Liberty duo but I'll have to check it more thoroughly...
For now it's a pain in the neck, all this double handling of postings and e-mail...
So if this msg turns up twice, don't blame me... :-)

Source record: 102787

(Pasting this straight from 2188.txt into QED now, to avoid yet another "header malforming")

I get connected, I see a IP address, I can PING myself, and that's as far as it goes, when I try to Ping the ips host (207.212.176.3) the TX light flashs, the counter goes up, but NOTHING comes back.

I am starting to think that this Atari of mine will NEVER be on the Net.

So much for Dennis' posting.

Dennis, you should focus on STING, STING, and STING ONLY NOW!

Check everything in your Autofolder (start with a new one on another partition if that's possible).

Put in DRVIN.PRG (first one in this row), MFP.PRG, MFP_TT.PRG, SCC.PRG (all from HSMODA07!!!!!) and finally STING.PRG and STING.INF (be sure STING.INF is SET PROPERLY to direct to the folder where Sting IS!!!... and be sure STING.PRG is LAST in the autofolder!). If you NEED anything else, put it there too, but try to keep it as clean as you can.
Also install just one ACC: whatever, XCONTROL, ZCONTROL, COPS to get your CPX'es going (be sure to have SERIAL, STING, STINGPORT and STINGPROT going - I'm not sure whether Stingprot is needed or not, but leave it for the time being just in). Make sure at least these are configured OK (Sting Port Setup should NOT be ticked active). Check all options are OK, i.e. SLIP or PPP, whatever you gonna run. Sting Internals should be set "active"!

Run another check on your DIAL.SCR, double/triple check all names, numbers. Check the Route.tab for this line 0.0.0.0(tab tab)0.0.0.0(tab tab)Modem1(tab tab)0.0.0.0, and be sure there's no # character prior to that line. In fact all other lines MUST start with the # character. If you're using Modem2, then change the line accordingly (check your CPX settings also for that, just in case).

Have you got all the necessary STX modules in a folder "MODULES" within the Sting folder????? PUT THEM IN THE STINGFOLDER!!!!!

Check DIAL.INF, it should read C:\STING\ (or wherever you keep Sting).

Once again, just delete CACHE.DNS! Don't need it now!!!

Reboot and check the msg Sting sends out at boottime (heck, I know that's nearly impossible on a TT, but try to find out if it comes up with "....modules loaded").

Start Sting and wait till it says "CONNECT" or whatever. Then start the PING tool and ping first on 127.0.0.1 if that's OK try to ping your ISP. As long as

you don't get packets returned, it's useless to move on to Newsie/CAB or whatever other client, since you need to be able to ping decently with your ISP first before the others will do anything.

Now, if this WORKS, try Newsie. See if the msg "Can't resolve hostname" is still displayed, in which case you should double/triple/quadruple check the settings for Newsie. If it don't, quit again and next check the two files Route.tab (for corruption) and Cache.dns (it should be there now or after you quit Sting).

If that's OK you can try to move the whole stuff back to where it should be, remember the running order for the HSmoda programs and Sting to be last, and see if it still works. If not, some of your autofolder stuff is simply clashing, but I doubt that...

Hope this finally turns out OK for you,

Hi Chris,

you missed the postings here some weeks ago.
Right, go into Soft-PC and select "Create drive", file a name for it (whatever), then go to the menu item "C-drive" and specify the newly created file for that. Next Soft PC will tell you to "reset", so click "reset" and wait. Next go into DOS and start FDISK. Tell it to create a DOS partition on C and format the disk (don't worry about your Atari HD, it just "formats" the file. After you've done that, install DOS on to your C-drive (that's the Soft-PC's C: drive). If all the systemfiles are there you should be able to boot from this "harddisk" from now on (isn't that a command FDISK C:\ s or so???) (I'm simply not very familiar with these DOS boxes, so I'm not sure about that).

You can create a harddisk file of 32 Mb for Soft-PC with DOS 3.30, I tried this myself a while ago, but remember: the HDF-files are just fixed ones, so a 32

Meg drive creates a 32 Meg file, even when it's "empty".
If you want to use the Atari filesystem to work on too, you need some more
files and folders, you can get them from my homepage (see below). There are
instructions with the file on how to proceed.

Hope this helped you out.

I doubt very seriously that Milan has any rights at all to TOS, unless a
German subsidiary of Atari sold the rights to the German version.
Actually the legality of that is dubious condsidering the
Atari/DRI/Novell/JTS/Hasbro quandry.

Without having your system on my test bench, where I could run a thorough diagnostic and tell you definitively exactly what the problem is, here are the most likely causes of your problem:

- bad disk drive
- bad drive controller chip (WD1772)
- bad Motorola sound chip (the sound chip controls timing)
- bad GLUE and/or DMA chips

> that???

Sure ! NEWSie does not "use" GEMDOS when corrupting the files, i.e. it
does not open and write to them the normal way (Would be no point touching
these files). So definitely the damage in done in an indirect way, by NEWSie
corrupting internal GEMDOS or even BIOS structures, which upon some following
action by GEMDOS results in GEMDOS "unintentionally" destroying those files.

Since GEMDOS handles the filesystem, no filesystem mechanism is sure to work
in this situation, as it will deal with corrupted internal data. This holds
for write-protection too.

Corrupting internal data can be done in various ways, most likely is that
a pointer in NEWSie went wild. For finding such a bug in NEWSie it is impor-
tant to find out some sequence of actions that reproducably makes this bug
strike. By applying this sequence, John can find out what NEWSie is doing
in that situation.

> So I think something went completely wrong in Sting's trying to write the names
> for the servers into the Cache.dns.

Can't be the culprit, as ROUTE.TAB won't be effected. It is not touched any-
more after bootup.

Also, other clients would exhibit the same bug. They don't. I believe I've
never seen the bug because I rarely use NEWSie.

> Peter, I believe Petter Toneff wrote back he had a similar problem and he as
> well believed it was Newsie screwing up. Personally I don't think Newsie is to
> blame, the problem is: as long as you cannot reproduce this on your own machine,
> you're getting nowhere... (maybe try installing Liberty/Freedom temporarily to
> find out if these are the bad ones...?)

Why don't you deinstall those temporarily to find out ? There is no guarantee
whatsoever that (if it's due to Freedom) the bug will show up in an even
remotely similar way on my machine. So chances are that I'd miss the effect
entirely, while you won't miss if the problem is gone after deinstalling them.
Apart from that I *know* these programs do illegal things, and that's why I
do not want to install them.

Cheers Peter

>
> What exactly is the purpose of the DNS cache?

For Internet traffic, numerical IP addresses must be used, like 130.75.75.16
Domain names like pallas.amp.uni-hannover.de must be resolved into the
corresponding IP address whenever some client or server does open some
connection. For this, the name server must be queried. As that is a network
action, it takes a couple of seconds if the network or the name server is
a bit loaded. Therefore, the association of domain names to IP addresses is
kept locally in a cache, looking up from the cache only takes less than a
tenth of a second. This is *very* noticable in case of Web access if a page
contains many small pictures and their hyperlinks contain the full URL.
It is noticable with other net services too.

In order to keep the aquired data even if the machine is switched off, the
cache is written to CACHE.DNS each time a resolve action results is a true
DNS query and new information is acquired. The file is therefore reloaded
when STinG is booted.

Size of the cache etc. can be configured in the "Protocols" CPX / "Resolver"
page.

The HSMODEM package contains english docs too. They are appended at the end
of the german docs, in the same file. So just browse a bit in the file, a
bit further on from the file start you should find english stuff. Harun
admits his english is not the best, but I guess it's readable.

louis@holleman.demon.nl (Louis Holleman) writes:

> Next I start up Newsie, but Newsie says: hey man, those addresses are wrong,
> they should be "whatever".

No. NEWSie has no direct access to these names. NEWSie has no way whatsoever
to find out which names are cached (i.e. in CACHE.DNS).

> Newsie works OK, and in the meantime or just later,
> I don't know, Sting wants to write the new addresses into Cache.dns but fails
> to do so, instead it corrupts the Route.tab and the Cache.dns.

Since ROUTE.TAB is never accessed after bootup, this corruption can only
occur by corrupted internal GEMDOS data. For that, it's accidental that it
hits GEMDOS, it can well hit STinG or even NEWSie itself. So you cannot
deduce anything from irregular behaviour *after* this bug has struck.

The only important point is that the bug does not strike if NEWSie is not
started. Nobody has seen it happen without NEWSie. That should say enough.

> people too, but not with just anybody... It's probably depending on what's in
> your system. I have been thinking of Liberty/Freedom straight from the
> beginning, that's why I mentioned it in my set-up.

Although possible, I rather doubt that it involves third party software.
I also doubt that the bug is really gone. That's the treacherous thing
about pointers going wild : It may effect memory that is rarely or even
never used, and that hides the bug very effectively, until much much later
when some minor change in the overall configuration makes the pointer go
to and corrupt some important data, and the bug becomes obvious. Makes you
think your software is fine since it worked all the time - wrong.

So I definitely think there is still data corrupted in your system, just
it does not corrupt those structures anymore that led GEMDOS to corrupt
ROUTE.TAB and CACHE.DNS. Maybe it corrupted some other program instead
that you have on your hard disk and which you haven't touched in a while.
This is not to scare you, but is the reality with all machines that do not
implement efficient memory protection.

This is basically the background for my suggestion the other day that John
should include certain header parts *after* the article has been edited.
There is no need to ever edit the References: line, and it only can cause
trouble if either the editor (by "formatting") or the user mingles with it.

I guess you should try to convince your ISP that using CHAP for private
users is like "shouting sparrows using cannons" as we germans use to say.
Ask them to provide you a PAP account.

Very few ISPs use CHAP, so you really have bad luck here.

That's bad luck for you as STinG does not support CHAP (Challenge Handshake Authentication Protocol) as yet. CHAP is significantly more demanding than PAP, as the host may "challenge" you at any time to authenticate yourself, while with PAP authentication is done only once (at the start of the session). Also, CHAP does not simply transmit a fixed password, but the "password" is *calculated* each time the challenge arrives using data supplied with the challenge.

Currently (AFAIK), the PPP daemon (pppd) for MiNTnet is the only Atari software that does CHAP.

C> Does anyone know what the dip switch settings should be on a Megafile
C> 30 to make it Unit 0?

I can only tell you what worked for me when I had those noise beasts.

switch 1 2 3 gives unit
on on on 0
on off off 1
off on off 2
off off on 3

I hope this little table is clear, eg switch 1,2 and 3 on gives unit 0.
hopes it works for you as well.

I doubt such a cable exists ready made. You'll probably have to build it
yourself, based on the pinouts you'll find at:

1531. First Word Dot Matrix Default Driver

Newsgroup: comp.sys.atari.st
Date: 1998-04-22 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <353da455.1231870@news.tmisnet.com>
Source record: 102593

Greetings!

I have received an email request for help by
an individual who needs to convince an Okidata
printer (model number not stated) to receive
output from First Word.

Is there a "plain vanilla" driver that works
with most Epson-compatible and near-compatible
printers? Is there a "proprinter" driver
available (same thing)?

In my initial reply, I suggested getting an
Epson Color Stylus 400 'cause they're cheap
and because Epson makes available a detailed
"ESC /2" printer control code manual, suitable
for creating your own printer drivers.

The original request is detailed & lengthy, which
is why I haven't posted it here. I'll be glad to
send it via email to any First Word Gurus who wish
to help out.

Thanks!

When Atari was still part of JTS, they were checking into whether they could release TOS into the public domain, but they were checking on GEM rights still owned by Novell or Caldera (Caldera bought many Digital Research properties from Novell, such as DR DOS and, supposedly, GEM). As far as I know, that was never finalised, but it's also been rumoured that Caldera was to release GEM into the public domain -- if that's occurred, then I'm sure there wouldn't be any legal arguments about freely distributing TOS (unless Hasbro wants to keep it for themselves! <grin>).

Hi Roger,

I received an email from Steve Hammond, suggesting to leave an old TCP.STX in there, I did just that but the problem remained. Now I've fetched two old versions of Sting, 1.06 and 1.08 and replaced Sting.prg, Dial.app+rsc, and the Centr, Serial, TCP, UDP and Resolve.STX'es by the ones from version 1.06.
I'm back on Sting 1.06 and Dialer 1.10 again and the rates are again as they used to be... It may be that the older version of TCP.STX wasn't old enough when I put it back in :-), can't figure out exactly which one it was but it was newer than the version supplied with 1.06.
So I will move on with newer stuff and see what happens. Maybe I should only leave this old TCP.STX in there.
In the meantime I set QED up to wrap lines in inserted text, not on loading text, so right now the headers should be left as they are, and I don't have to keep an eye on my own writing to avoid long lines. Guess that problem is settled too then.

It's all becoming what it should be: getting fun out of Internet :-)

Firstly can anyone tell me if they have sucessfully made disk images of MGP for the ST and whether they run on pacifist or not? I tried to make all the images and although they apeared to work and the game starts to load, a message stating that disk 2 is corrupted appears. If anyone has got working images could they possibly mail them to me.

PS. Before anyone moans, I do own the game and I've got the manual which is needed for copy portection anyway.

Hi Noah!

Sounds as if the problem is somewhere between the Floppy disk controller
WD1772 and the DMA chip. Usually both of them are not cheap, not socketed
and therefore hard to replace (though I did it several times...).

But first you can try other drives and perhaps an other 34-pin ribbon
cable...

I presume you mean problems using CAB 2.x.

I also had this problem. I solved it with an update to CAB2.6
(first I had v2.5). If you can explain your problem to ASH, maybe they
will provide it to you without any futher costs (no warranty for
that).

Hello.

As said many times before, you miss one fact:

The MILAN developer crew is owner of all rights on all TOS versions ever
developed in the past, now and in the future, including all sources,
patents and trillipampis (?).

Just as a hint.

Bye,
Carsten

Hello all,

I just wanted to throw out a few ideas for articles that I'd like to see submitted. If you are in the position to provide one of these, please get in touch and we'll talk about it.

Software authors: Please contact me to get your product reviewed, be it public domain, shareware or commercial.

Possible articles:

Falcon accelrators (Nemesis, Afterburner) - installation, use, etc.
Running for the Falcon
New Positive Image version
Review of the Hades or C-Lab MK-X
Using CAB 2.5
The "other" web browsers (Web Suite, etc.)
Newsie and hints for using it
A tutorial on setting up STing
Comparison of web authoring tools

If you are interested in writing an article or review, please get in touch with me.

> then I'm sure there wouldn't be any legal arguments about freely

At the "Unofficial CPM page" one can download various CPM and GEM flavours including CPM/68k, Gemdos source code for the ST, and the complete Atari Developers kit. The software are not PD but they are aviable for noncomercial usage. For some programs are even the source included. The focus is mainly Z80/8080 and 8086 programs but there are some 68k stuff aswell.

If one likes to take a look at it, it's aviable at: http://cdl.uta.edu/cpm

After all, if I own a program and sells the right to use it to someone, no one can stop me to give it away later unless the contract with the first buyer told so. If I keep the rights to it, I'm free to do what ever I want to. In this case it seems like that, Caldera wanted to give away something they own and that used to be sold.

If Hasbro wants to give away something they own and that used to be sold no one could blame them, right?

//Kent Johansson

Hi Dennis! He is already familiar with BBS Express! ST...he calls my BBS semi-regularly! <smile>

I should point out that BBS Express! ST does not natively support CD-ROMs, but that rather 3rd party and individual scripts do. ;-)

RATsoft, AFAIK, does support CD-ROMs in its later versions. However, I've never, ever been able to contact the Sysop, or had any of my E-mails returned.

Phantom, I have version 2.x of RATSoft...that I've never used. (well I installed it once). The regular price is $89-99.00, and if you want it, I'll let it go complete for only $30.00! Let me know... ;-)

Not sure about the agreement between JTS and Falke, but isn't there a distinction between owning a licence to distribute and develop something, and the full rights to resell, make PD or whatever.

If Falke has entire rights to TOS, did Wizztronics negociate with Falke or with JTS to get theirs ?

Maybe a clarification about who owns TOS, with distinction about the type of licence, would be welcome.

As far as GEM goes, I beleive it's still retained by Caldera, as they have only released CP/M in the public domain.

```
Cheers,
Nick

>need to leave NEWSie each time of course.

As i've reported here earlier, I've got the file corruption bug with
Newsie. In my case it's the CACHE.DNS file that gets destroyed every
time Newsie is run - I've never had the problem with ROUTE.TAB.
It happens just after Newsie displays it's first status dialog (i.e.
"Destination host is unreachable" if I'm offline) and just before the
first window is opened - in my case the newsgroup window which I've
configured to open on startup. Newsie then makes a short harddisk
access and when I check, the CACHE.DNS file is destroyed. (It always
ends up with the size of 46 bytes).
To be absolutely sure Newsie is to blame, I've tried with different
harddisk drivers, with a clean setup, with and without Sting being
active, with Newsie running from ST-ram or TT-ram. I've also tried
relocating the /STING/MODULES folder, and made sure my hd-partitions
are error free and defragged. It still happens every time.

This is on a TT with a SCSI hd, and it happens both under TOS and
Magic. On my Falcon with an IDE hd I don't have the problem. To at
least avoid the error message from Sting on bootup (dns cache load
failed), I've set up Xboot to copy an undamaged cache.dns file to the
/STING/MODULES folder...

Source record: 102610

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

Ahhrgg !!!

The size of your device, IDE - OR - SCSI, is - e q u a l -!!
But not the size of one partition!!

The size for one partition is limited to 1 Gig

So made simple 5 partitions each 1 Gig from your 5 Gig Device..

> Thanks!

Falcons hold their value far better than STs. The perfect Falcon would be 14 megs, have TOS 4.04 (4.01 is ropey), have had the 'audio mods' done on it and at least an 80Mb internal IDE drive. In the UK this would go for around 350-400UK pounds and would probably sell relatively quickly at this price. Yours is a slightly lower spec so adjust accordingly.

I'd buy it if I had any money :(
regards,
jim.

Unfortunate. Not many ISPs *insist* on CHAP, I believe. Didn't you say Charles Silver actually managed to get a working connection with your ISP though? In which case it could still be a setup problem.

Perhaps you need to reactivate your CIS account for a month or two while looking for alternatives (I appreciate your difficulties with your remote location). At least you won't be cut off completely that way.

Does anyone know what uses the serial number? I've had a look at the code
for mediach(), which is the only place in TOS where I thought it may be
checked, and it only looks at the write-protect line. There's no sign of it
checking a serial number. The code here appears to be the same in TOS 1.62,
a disc loaded TOS 1.00 and in Magic 5.

I don't think all PC's require 'MSDOS' in the boot sector. I wrote a little
program to modify the boot sector so it looked like DOS 5.0 had formatted
it. The only reason I used DOS 5 was that was on a disc I was given. All my
discs that I used with a PC had the same boot sector, the first few lines
of which are:

0100 EB 3C 90 28 56 2F 49 50 49 48 43 00 02 02 01 00 .<.MSDOS5.0.....

I'm glad to say it hasn't done anything like that to me, not yet anyway. A couple of things I've noticed about KnifeST is that it assumes a 2 sector cluster and it has some difficulty working with partitions with more than 32767 sectors. 'Tis a pity since it's a nice disc editor.

I have this problem as well. It was 'cured' by using the TCP.STX module from
the v1.08 release. The funny thing is, some people with the same ISP can use
the newer modules with no problems.

Hi Petter,

this beats me again... I simply can't imagine how Newsie can even FIND a
Cache.dns... But if you got Sting not active and it still happens it must be
Newsie. I'm wondering now, would it also happen when you leave Sting.prg
out of the autofolder??? Have you tried simply deleting this Cache.dns, then
start up and see what you're getting next? My Cache.dns is 83 bytes, and since
the one that's in now was created it has not been touched again, also not the
Route.tab.
I'm on a TT too, all SCSI gear and running under Magic.

>This works fine.

Hi Peter,

well, during the day I've reinstalled Sting 1.06, then 1.08 and moved up to 1.15 again. I've left the TCP.STX from version 1.08 in, the rest is all the latest stuff and now the transferrates are what they used to be. Have to check now if FTP-ing and uploading files to my own site has been fixed with this too.

Apart from that, it looks like everything is under control now. Well, 13 days all together to get everything working 100% isn't that bad, isn't it? :-)
(and I even have been working for my job too in the meantime...)

I can duplicate Chris's problem here (Falcon/Magic5.11), choosing "Edit Nicknames" with no other window opens results in Newsie crashing out with an exception error. If I've opened a window then there is no problem.

r> I am running Magic, so you therefore should be viewing the Edit
r> Nacknames via the WDialog (in a window).

A brief test just now seems to suggest that running WDialog appears to correct matters. Opinion seems divided over whether WDialog is needed or not with later versions of MagiC tho'.

Talking of windows, would it be possible to change the "Status" window to have a title bar with the name of the newsgroup that's being downloaded pl

Message-ID: <#uICBQib9GA.308@nih2naac.prod2.compuserve.com>
Source record: 102628

Well this AM, I sleeped in a bit later than norm. Got up at 8am,
went out and let any stress go away by working in my garden for about
an hour.

I then called Abe at my local IPS and talked to him. He said they do
NOT use CHAP! That they used PPP/PAP, hmmmm.

So I dropped down my BBS and moved a lot of stuff from C:\ over to G:\
as I've only got 125megs per drive, don't want to fill up C: to fast.

I then made a NEW folder named STING on C:, I then unLZHed the STING packet
AGAIN, and folder by folder moved the ones I needed to the one on C:\.

I then edited the needed files so STinG would know were to look.

I then rebooted.

I have found out that at 1st bootup something is sending an ESC keypress
to the modem! I bring up STinG and have to do a DISconnect before I can
do anything else.

I have also found that when I set the STinG's se serial.cpx to flow
control of rts/cts, and even if I save it, the rts/cts setting does NOT
stay active. When I recheck it, it's 'unknown'.

But after doing all of this, I use the sting dialer to try another test

I make connection ... everything goes as before ... it says as before

that I'm hooked up. The screen closes down leaving the menu there, so
once more I pull up PING, ok 1st ping, 127.0.0.1 ... All OK ...
2nd PING 207.212.176.3 (this has never worked) .....

BINGO!!! Return PINGS!!!

I drop out of STinG, open window to Newsie, double click on Newsie,
it comes up I pull menu down and click on connet to host .....

IT WORKS!!!

Now I have questions ... (Your not getting away that easy!)

What would be the best editor to use with Newsie? I tried to send a
message and it tells me no extrnal text editor, to check my pref setting
or something like that. Does the editor have to be in the same folder?

If I use the OPEN URL and type in one, does the program just send off
a request? I seemed to be able to do other things.

Hay! How about a test message to me at starlord@ptw.com? I hope that's
the right e-mail address.

One Small Step for Me, A LOT more to go!

1567. I've Bought Toad Computer's Atari Stock!

Newsgroup: comp.sys.atari.st
Date: 1998-04-22 00:00:00 UTC
From: atari@Radix.Net
Message-ID: <6hli70$9k7$1@news1.Radix.Net>
Source record: 102629

Hello,

This past weekend I made a deal with Toad Computers and purchased their entire remaining inventory of Atari hardware and software. I am working on getting everything inventoried, and also dealing with the local government to be able to sell off the items I have no need for. So, if anyone is looking for anything special, drop me a line. So far I have a list of all of the Lynx games on my site, along with the suggested retail prices for them, still working on what I am going to sell them off for.

So, looking for something special (and released over 1 year ago) drop me a line, and I can keep an eye out. I still have to transport 3/4 of their remaining stock from Severna Park to my location in Southern Maryland. My web address is in the sig!

Thanks!

1568. NEWSwatch 2.00 released

Newsgroup: comp.sys.atari.st
Date: 1998-04-22 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <85328804_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 102630
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Version 2.00 of NEWSwatch is now available from my web site.

NEWSwatch retrieves and sends news articles in NOS and Oasis2 format, and thus provides a STiK/STinG compatible layer between the following news clients and the internet; Oasis2, Okami 1.29 and higher, Oasis1.3x, NOS and Snews.

The major changes in version 2.00 are that it now works with news servers that don't allow retrieval via the NEWNEWS command, and it also works with news servers that require authentication via the AUTHINFO command.

Regards,
Gary

Only if you help us out !

I am currently working on issue 3, We have had some new members to support the new zine but I am sure there are a lot of you out there how would like to write somthing.

If you would but dont know how, then write a articles for the WIBBLE section of MEGA. Simply keep typing the first things that come into your head for a line or 100, and mail it to me.

Have any ideas on stuff to include, I like to hear from you.

Sorry to all those people who are waiting for MEGA to appear on my site, It should be there shortly. I will mail it to people who request it.

If you have already got MEGA, Make sure you have got the disc_1a.zip and disc_2a.zip files, The ones without the "a" are a faulty version. This was mailed in a almighty cock up on my part. The main problems are bottoms of files missing, a few not on the disc and the music will not turn on if you turn it off.

Anyone who I sent my questionnaire to , all have now been removed from the mailing list as they have not given permission for me to keep them on recored.

Please take a few moment to send your support to MEGA, I know there are a lot of readers out there, so Keep the mag going and offer your help. Support you ATARI computer, don't hide behind your keyboard, let the world hear you !!

>
Hi again Chris,

(it won't hurt simply clicking around thru' the menu items, sometimes you'll be amazed what you will discover!)

OK, here goes:

Go to the PC-drives menu, click D: Hard drive and find a little menu about "emptying" an existing drive, creating a new one or specifying another one.

I call all my different "hard disk files" XXXXXXXX.HDF, having 5 or 6 of them ranging from 5 Mb thru' 10 and 15 and 20 Mb. Once created a 32 Mb as well.

AFAIK the only version circulating IS 1.4alpha05, there never was an official release...

Oh yeah, I forgot to tell you: someone mentioned it works on DOS 5.xx too... and I believe Boris D. Cahan had it running with DR-DOS 7 or so.

Hi Dennis (if this kinda quoting goes on, it'll end up with a msg mentioning
all hooked up to this NG :-))))

I've now got the one from Sting 1.08 working. That one is 10.541 bytes, date is
13.10.97 (European format).

I tried with a newer version (NOT the one from 1.15 but I am not able to
determine from what package that one was) but it didn't do me any good.
So I figure if you have problems, put in the one mentioned above.

Have a look in the STinG Port Setup CPX and uncheck the Active box if it's checked. It should only be checked if you're setting up a LAN. Otherwise it confuses the dialer into thinking you're connected already, hence the need to disconnect. For dialup connections, the dialer handles activating/disactivating the port. NB this is different to the Active check box in the STinG Internals CPX which turns STinG on and off (so other programs can use the serial port). That needs to be set to active for STinG to work.

>I have also found that when I set the STinG's se serial.cpx to flow

>stay active. When I recheck it, it's 'unknown'.

Not sure about this one, sorry. ISTR something about not changing where you save the setup file after saving it the first time as the CPX remembers the location, but this is a bit hazy as the discussion was some time ago. Anyone else remember the details?

<snip>

Any of the standard ones, though a good choice would be one that understands the AV protocol, ie Everest (shareware) or QED (freeware AFAIK).

>I tried to send a
>message and it tells me no extrnal text editor, to check my pref setting
>or something like that. Does the editor have to be in the same folder?

I think you set the path to it in one of the preferences dialogs, but one of the myriad Newsie users here will know the precise details. it certainly doesn't have to be in the same folder (or didn't last time I tried the program).

>If I use the OPEN URL and type in one, does the program just send off

Dennis,

YEA!!! I TOLD you it'd work! Jeez, you really like taking it right down to the wire, don't you? <G>

As for what editor to use, I use STeno from Gribnif, but any ASCII editor that works in a window should do just fine. There's qed, Everest, and a slew of others that I've tried that work just fine. It's mostly personal preference.

Installing the editor as your default editor is fairly easy. Just choose the "Preferences" menu, go down to the "Path Options" option, double-click on "External Editor" and point it in the direction of your text editor of choice". Then go back under "Preferences", select "News Reading Options", and click the check box next to "Use External Viewer". After you're done with that, save the configuration (Preferences/Save Preferences). Then you should be good to go.

There are enough options in NEWSie that you'll be asking questions for at least a week. It's a good thing you got that ISP thing straightened out. <G> Feel free to ask questions about whatever strikes you. I find that a lot of the time I learn answers to questions I didn't even know I had by reading about what others want to know.

Again, congrats on getting STinG to work... a nice feeling, ain't it?

Take care,

Joe Mirando @ STReport

HTML-Help performs conversion from 1st Word plus to HTML. Not a ttp
program, and it has dozens of other features which are requested in this
group for a thousand time. The program has also an ascii to HTML
converter (similar to the built-in coverter in HomePage Penguin).
Just take a look at my homepage:

<mega snip>

I think you just made the main point here. Judging from the
discussions in here, it's happened with several versions of Newsie and
the files get messed up as soon as Newsie is hooked into the system.
People who don't use Newsie (eg me, apart from *very* occasional
testing to see how it's getting on) don't have the problem. QED...

AIUI (and Peter will doubtless correct/elucidate if I'm wrong)
cache.dns is just what you'd think from the name: it's a cache for DNS
lookups. So the contents as supplied are largely irrelevant as it's
refreshed on a regular basis. If you check the file date/time stamp
you'll see it's updated each time you use STinG: mine currently shows
host names for the machines I connected to at last login if I view it
in STguide. This is used for all clients: I use POPwatch and NEWSwatch
for mail and news collection, plus AFTP, CAB, Finger, TVT102 and the
network time setter. None of them messes up cache.dns or route.tab.

BTW route.tab is only *read* by STinG (mine is still unchanged/
untouched since last August) - something has to *write* to the disk to
mangle it.

<crosses fingers that the whole thing doesn't fall apart now...>

I can only read CDs using MiNT at the moment either with or without
N.AES-1.1.7 and got no problems with 0 byte files so far.
The only thing I don't like with this CD is that there's no file name
completion in the shell I use unless I type UPPER CASE :-(

Martin> Probes with Thing? That's something new for me. Did you
Martin> install the whoel stuff properly?

I'm not sure; I copied the N-AES and THING folders so I can get N.AES
but Thing throws 2 bombs when starting then (actually it doesn't throw
bombs due to a tiny auto folder program that's turning them into alarm
boxes). The hypertext docs say that there are some problems with TOS
older than 1.0.4 but that didn't sound to me like getting bombs right
at the start.

A "friend" that setup my brothers Pentium installed his "beta tester"
version of Win 98 on his machine. All I can say about it is if you
think that MiNT and MiNT Net are difficult to work with, don't
bother:). The complete interface is like using a 100 menu layer Web browser
without much clue as to where your going. But again, I have never used
Win 95, so maybe I wasn't trained properly:).

Hi Louis,

Sting is now up to 1.15 and can be downloaded from the following Web site
http://www.stud.uni-hannover.de/~perot/index-e.html. and grabbing the
new Newsie wouldn't hurt either. To grab the Sting package follow
the Sting Downloads link and dowload all the programs there that
relate to Sting. This should correct the problem as I am using
the newest Sting package and have no problems.

We are sorry that nobody has yet received their CD Roms to complement issue 8. We were expecting them to be delivered to Joe when he was at the German Neuss show the other week. Unfortunately they were not delivered, and we were told that they were "in transit" from the source in France. We are following this up, and as soon as we receive them they will be dispatched immediately.

We have no reason to believe that there is a problem, just an unfortunate delay.

I'll update this group as soon as we have them.

Source record: 102442

Hi,

Having only recently acquired a 520ST, I hope that someone in this group can help me with some (seemingly) simple problems that are taking the fun out of owning an Atari. :(

Today I picked up a used Supra 30 Meg hard drive, but I can't get the ST to recognize that it exists. I've plugged it into the 19(?)-pin HD slot in back, and the drive powers up, the fan whirrs, but no icon comes on the screen. Do I need to get a floppy boot disk, or should the ST detect the HD anyway? Is there another connection needed that I don't know about?

I've also been unable to use my floppy drive, until now I'd assumed a drive malfunction, but... I've tried two 3.5 SF354's: I was able to format one disk successfully with the first, but now ST disks won't boot and the only disk it will read is an IBM-PC one, which it reads intermittently (brings up file list with varying number of files, none of which can be displayed or executed (of course)). Today I had the opportunity to try a second SF354, but kept receiving the "Drive not responding" message; this drive sounded *horrible*, however, with excessive knocking and grinding.

So my second question is, are these drives simply prone to failure, or do both problems add up to a malfunction in the ST itself? (Completely clueless of me, I know, but perhaps a brief lecture on connecting the hardware properly is in order too.)

Can anyone help with either problem? I hope I don't have to re-format the hard drive; I'd really like to know what might be on it!

Thanks!

peace,
-Kev-

It won't probably because NEWSie then should complain about missing STiK /
STinG, and the check for this in NEWSie is done probably before anything
else is done, so I'd guess NEWSie just doesn't get to the point where it
corrupts foreign memory.

Although this is possible (doesn't hurt),

> I bring up STinG and have to do a DISconnect before I can
> do anything else.

this is not related. The latter is by a misconfiguration. You saved the
"Port Setup" CPX settings with the modem port set to active. Don't do
that. Deactivate and resave. This activation is the Dialer's business.

Do not ignore the Frequently Asked Question collection in STING.HYP !
(This is discussed there.)

There seems to be a communication problem with HSMODEM. I don't have this
problem, so I can't investigate. Should be fine though apart from not
displaying the setting.

So it's likely you had some software interference. Copy the software back
step by step, and check each time, to identify the troublemaker.

Can you please check the one from Jan 9th 1998, 10707 bytes ? I archived
source code for that one and the one you mention above. Does the slow-xfer
problem exist with that version ?

Cheers Peter

> the newer modules with no problems.

Bad news. Means I cannot log into the ISP of someone who has this problem
to reproduce it.

Ah well, I found it unlikely to depend on the ISP in the first place, as the
ISP's only task is to forward TCP segments ... But what remains ? The actual
hardware ? The software enviroment ? The ISP account configuration ? To clear
up the latter, maybe two people with the same ISP (one with the problem, the
other without) can exchange their accounts for a short test ?

As soon as I finished moving I'll try to undo step by step all changes done
from the TCP in the 1.08 release to the current version, hopefully pin-pointing
the relevant change this way. Won't work for all changes, but I hope, for the
relevant one ...

Cheers Peter

As I said elsewhere, STinG does not support CHAP (yet ?) So that ISP won't
allow you to do anything as you can't authenticate yourself, unless you
talk them into giving you a PAP authenticated account.

1598. New at Systems For Tomorrow (April 24th, 98)

Newsgroup: comp.sys.atari.st
Date: 1998-04-23 00:00:00 UTC
From: sales@SystemsForTomorrow.com
Message-ID: <6hr805$q83$1@sunset.kansas.net>
Source record: 102450

New at Systems For Tomorrow April, 24th 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Delta Labs CDs for TOS Computers
We have received new stocks from delta labs! These German CDs contain all kinds of goodies. Most contain some full versions, and though they are German CDs, English software can often be found. For detailed information on each CD go to http://www.deltalabs.com.

Whiteline Alpha $34.99
Whiteline Gamma $34.99
Whiteline Delta $34.99
Whiteline Omega $34.99
Whiteline PSI $39.99
Whiteline Linux/68k 2.0 $44.99
Whiteline Complete MiNT '98 $34.99
Whiteline all about Signum! $29.99
Whiteline Substance $34.99
Whiteline Transmission $19.99
Whiteline Selected Signs $29.99

Revolution CD Magazine
We now have limited stocks of the first seven issues of this German CD based magazine! Each issue contains German language articles and reviews stored in HTML format. Additionally each issue contains around 100 MegaBytes of Atari Software in various languages (including English.) Only $11.99 each, or only $49.99 for all seven.

Ultimate Virus Killer 2000 for TOS Computers $19.99
The Ultimate Virus Killer 2000 (version 8) is probably the most versatile and definitive product in the battle against computer viruses on the Atari ST/STE/TT/Falcon; a full- fledged tool that has taken many years of painstaking development. You can use this tool to de-infect your disks and programmes, destroying the viruses and leaving all other information and data intact. UCK2000 will recognize and destroy over 100 viruses! The full version is only $19.99, upgrades from any previous version are only $7.50 (requires the return of your origional UVK disk.)

Atari Computing Magazine Back Issues $9.99 each
Issues #4, #5, #6, #7 and #8 of Atari Computing are available by special order as back issues (while supplies last.) Back issues are shipped when the next new issue arrives. Order now to insure delivery with issue #9 (Early to Mid May).
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Atari Computing Subscriptions
In addition to our standing order option, we are now accepting 3 and 6 issue subscriptions to Atari Computing. Here's the deal: (Prices include Reader Disk and delivery to US or Canada.)
Standing Order: $11 per issue (must have a credit card)
3 Issue Subscription: $30
6 Issue Subscription: $55

Suzy B's Treasury Vol 2 CD $29.99
This CD from Suzy B Software continues the tradition of bringing you "a honey of a deal." It includes the best in Atari PD and Shareware, all clearly described by "The Unabashed Atariophile" of Z*Net, AEO and ST Report fame. It's been three years since the first collection and thousands of new files have arrived. Most files are compressed in ZIP format in order to fit more data onto the CD. We also have received more copies of the origional Suzy B's two CD set, now also priced at $29.99. Or take both volumes (3 discs) for only $47.98! From Suzy B's Software.

Link 97 for ST/STe/TT $89.99
Easly connect harddisks, CD ROM drives, streamers etc. to your DMA port. Technical features: SCSI 2 Commands (Harddisks above 1 GB can be used), Parity, SCSI Initator Identification (Harddisks like the Quantum Fireball series can be used), You can connect up to 7 SCSI devices. Note: Does not include driver software. From WB Systemtechnik.

Scan X: UMAX for TOS Computers $49.99
This new edition of the Scan X scanner drivers provides support for the UMAX Astra 1200s and VISTA S-12 scanners. A MicroTek E3/E6/35T+ version is also available. From Homa Systems.

Electronic Cow!
Three cool music applications! For more information check out the Electronic Cow link on our web site!

MIDI Arpeggiator for TOS Computers $27.99
Sound Chip Synth for TOS Computers $19.99
Snippit Synth for TOS Computers $29.99

Also Available:
HD Driver 7 $49.99 The best Hard Disk utilities
CAB 2.5 $49.99 HTML browser /w PPP socket for MagiC
Atari Works $79.99 Easy to use home/office suite.
Lattice C 5.6 $139.99 C Compiler.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Tetris II $11.99 Cool Tetris game
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon

Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

You could say Win95 is like Win 3.x but with a bar at the bottom for
swapping multitasking programs and a start program to actully start a
program. (rather like MagiC, where you click at the top and get that
menu?)

Well the next step is getting one of those text editors that works on my
system. I tried to use Mountains Pen-Pal software, but when I go to
save any text, it's always 'mailtest.txt', not the other way.
Plus when I go to exit, it bombs on me and I'm at desktop level.
I do find the message header there, so I load it into the text buffer of
Flash 1.6, add the body of the text and resave it. But this is like
pushing my old caddy uphill! :<

1601. HELP: Falcon not storing NVRAM settings

Newsgroup: comp.sys.atari.st
Date: 1998-04-23 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <6hnc60$ps6@news.Hawaii.Edu>
Source record: 102493
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

A friend of mine just bought a Falcon which refuses to store its
NVRAM settings (for default resolution, columns, monitor type, whether to
run memory test, etc...) Does anyone know if this is a hardware problem
that can be rectified, or some strange software issue?

Any assistance would be greatly appreciated.

Aloha,
John Perez - jperez@hawaii.edu

> as I don't have any Manuals.
> My main questions are: what is the cheapest way to connect a HDD to this machine?
> (I have some old IDE, SCSI and even MFM HDD's on stock)?

The cheapest is probably to get your hand on an old Megafile 20, 30 or
60, but they are small, slow, and old.

The best is without a doubt to get a Link97 SCSI host adapter to connect
any SCSI unit. You'll find it in Germany from WB Systemtechnik I think.

Check out the Quick FAQ (see my .sig).

> What good free/PD programs for making music and/or using MIDI are availible?

Sweet16 or Alchemy are shareware sequencers. You should find them on
most FTP sites.

>
> All answers via Email (pleeeese, i'm not subscribed), binaries thankfully
> accepted.

You are subscribed, since you are posting in here. If you are interested
in Ataris, it is a good idea to subscribe to newsgroups, at least for a
few weeks.

Cheers,
Nick

Check the delay slider in the STING.CPX (sting internals).
Drag it right down to the lowest value (10ms), reboot and try again.

1606. Gembench 90%

Newsgroup: comp.sys.atari.st
Date: 1998-04-23 00:00:00 UTC
From: Nicholas Bales <bales@hol.REMOVE.THIS.fr>
Message-ID: <353F5F2B.2542F317@hol.REMOVE.THIS.fr>
Source record: 102498

Yesterday I tried running gembench on my Falcon, connected to an SM124, and strangely enough, it came out with an average value of 90% of the speed of a Falcon in ST High. CPU was up to 97%, but some of the VDI stuff was down to 78%. Much slower than what it should be.

???

It's a stock machine, and this was after a clean boot with only AHDI loaded. No AUTO programs. Blitter and cache are set to on. Everything runs fine. I also tried running it in VGA modes and the results are similar, sometimes it is even below the STE values.

Any opinions ? would this be a faulty blitter or bad cache or anything like that ? Are there any other ways to check the hardware ? Is Gembench the culprit ? The same version always gave me 100% on my STE (well, at least before I started upgrading it).

Cheers,
Nick

I haven't used Pen-Pal, but I would recommend you try a different text editor. Edith is a text editor that will probably work. I think the preferred ones are Everist (I've tried this one and it worked fine) and QED. I use STeno (commercial product from Gribnif) and it works great. With all of the above text editors you don't have to worry about naming the file as Newsie passes the file name to the editor. Just click on "save" and then click on "quit" (or exit or whatever the program you are using is calling it). For what its worth, Newsie always calls this file the same thing, something like NEWSTEST.TXT, if I remember correctly.

: I just hope my isp will pull in the newsgroups I want, I got the dir

If it doesn't, you still have options available. My local ISP does not have a news server at all, but I can still read comp.sys.atari.st via Newsie. I found this marvelous web site (now that you have Newsie working, you should be able to visit it) at the following URL:

http://www.jammed.com/~newzbot/

This site lists publicly accessable news servers, and has a feature whereby you can search for servers that carry specific news groups. I did a search for servers that carry comp.sys.atari.st and found 75 servers. In case you can't get the thing to work, here are a couple I pulled from the list (I'm avoiding ones that are international, as they will take longer to access, and I'm avoiding educational institutions to be nice): apswebnt.apstech.com, dragon.stena.com, gatekeeper.transre.com, host4lx2.stj.com, janus.cypress.com, news.customcpu.com, news.sauder.com, newsy.mc.com, ns.macro4.com, ns.transre.com, server1.lgerca.com, vai.gr.com, ren.usr.com.

Just type one of the above addresses into Newsie's configuration menu where it asks for your nntp or news server. Keep the list, or the www.jammed.com URL, because public news servers may restrict news access at a later date and you will have to find another site to mooch off of.

If that Falcon older as 5 years?
Good chance for an empty lithium batterie in the NVRAM (DALLAS) Chip..

Try:

Reset the hole NVRAM by NVRESET.PRG

Made new settings with BOOTKONF.PRG (V 1.3) (Uwe Seimet)

Reboot after setting.

Watch that setting over night, next day..
If you found not the same setting -> replace dallas NVRAM
(Big chip under his keyboard...)

How to do that? -> DOITF030

From my limited experience of Newsie I think this is normal. Any
message being worked on is called mailtest.txt or newstest.txt and
once editing is finished it's copied to the queue with a different
name, ie the XXXXtest.txt files are temporary working copies.

>Plus when I go to exit, it bombs on me and I'm at desktop level.

Sounds like the editor you're using doesn't get on with Newsie. Time
to change to something else. I can recommend Everest (shareware) for
most things, QED has a lot of users and is free, as I said before. In
one of your other posts you mention Edith, which also a good editor by
all accounts and free but no longer developed (AFAIK). No idea how
well it gets on with Newsie. Everest definately worked fine with
Newsie when I was trying it out a while ago.

I found QED here on CIS, so I D/Led it and set it up. I have found one trouble with it, if I enlarge the text window it opens up with to a full screen, it'll still work,BUT the next time it goes to open, it gives me a dialog box with something about must have a 680 x something screen.

I'm running a Zenith data system monochrome monitor in TT med REZ and that's not big enought?

The only oddity I found running Nembench on my Falcon was degraded speed when running 16 or more colors on screen. When video set to 2 colors, it went to 100%. Since you are running an SM124, I wonder if there is some processor time spent in translating the VGA signal to SM124 digital.

Nicholas Bales wrote:

Same here.

The first thing I noticed was that it would access that Japanese site
www.hi-ho.ne.jp/d-lab/ which was publicised here a couple of days ago
and which caused the previous CAB.OVL to get confused. Promising - I
must try it out on some of my other 'problem' sites.

BTW, don't all rush to that Japanese site. It is composed in a
peculiar font (prob. some MS UNI-code) which is displayed as garbage
by CAB. I'm not even sure that the original text is english - it might
be Kanji.

Anyway, I've e-mailed the site to see what's going on.

Hi,

all I can add is that QED is a fine one too. Only thing you've got to watch is
setting "breaking lines" to OFF for loading text, and setting wrapping to ON
for inserting text. See my previous messages about mail and postings going down
the drain, resulting from QED breaking the (long) reference lines.

Same problem may occur with other editors.

Thank you all,

Initially my ISP didn't believe me and said that I had to configurate
my setup correctly.
But after my second mail to them containing the comments of you all they saw
the light and admitted that there was something wrong on their side.
They will correct it ASAP.

What puzzle me is that although my ISP is one of the largest in
Belgium nobody -read pc and Mac users- but me (I think) had problems
with it.

> itself although it says that he's on the Mausnet at "LU". It doesn't
> really make any sense to me though -has anyone been in touch with him
> recently or know where I can find him?

All MausNet-addresses can be accessed via the Internet with the
following addressing:

Givenname_Surname@city.maus.de

That means

Goetz_Hoffart@FR.maus.de

or

Oliver_Schildmann@LU.maus.de

(but I think he moved to: Oliver_Schildmann@LU2.maus.de)

The MausNet is a network of mailboxes in German-speaking countries. Most
Atari developers read and write there. Some of the Atari-groups are
exported to the Usenet, have a look at the "maus.sys.atari.*"
newsgroups. But "Atari.Programming", "Atari.News" (Updates & Announces),
Atari.Text and Atari.Clones are, because of SPAM, not exported to the
Usenet.

[oops, snipped who wrote this ...]
>Since Tos 2.06 the atari disk format has been 100% MS-DOZE compat. Try
>it on a Falcon for instance.

It's not the Atari at fault. It is most definately the PC, if only
because the PC will totally *destroy* a disk it doesn't like,
rendering it unformattable thereafter on either machine - whereas the
Atari has never done this.

I doubt any atari machine with a high density mechanism will ever
suffer from my particular problem (which has only a dd mechanism on
the atari).

>How hard is it to detect in a program whether or not long filenames are
>available?

Theoretically you shouldn't have to!

>I'm talking about from a programmer's aspect.

Just write "case preserving" code. If long filenames are not being
used then they'll be treated like uppercase anyway. For instance, if
you want to knock off the filename extender and replace it with
another extender simply look for the rightmost '.' (ie strrchr) rather
than the leftmost (ie strchr) iyswim.

In practice, there's always the problem of how long the buffer has to
be to hold a given file. The best way round this is to use dynamic
memory allocation (ie realloc) to expand and shrink the spaces
required, as needed. This can be simplified somewhat by using one or
two fixed but "large enough" sized buffers as workspace before
allocating the final sizes and copying.

In practice, Pdomain (iirc) will set/return the filing system in use
(if possible), and one of Dopendir/Dreaddir (I forget which offhand)
will tell you if the buffer you are passing to them is too small for
the longest name in a given directory.

Mine does. Whatever my problems are, I suspect I'm very much in the
minority.

>I bought a bunch of HD disks a while ago (pre-formatted (MSDOS) like most

>
>Getting back to Kobold and Hcopy (they both format MSDOS in HD and DD) I've
>noticed that they give the name of the program, not "MSDOS". So might this mean
>that even though they're supposed to be MSDOS compatible they might indeed not
>be?

This is the case with my Kobold version (2.5), the PC wants "MSDOS"
amongst other things, and 2.5 writes "KOBOLD" or similar.

>If they are, it would contradict what has been said about the bootsector
>having to have "MSDOS3.3" as mentioned here.

Remember in my case we are talking about Windoze NT4 Workstation
(Service Pack 3 + IE4). NT has a thing called the Hardware Abstraction
Layer which prevents processes getting at the hardware, so there is no
way I can write anything on the PC to help figure out what the problem
is. Even if relevent calls did exist I don't have the info to use
them. Finally, it wouldn't surprise me in the least if someone were to
tell me NT destroys the floppy on purpose as a security issue!

>>Information from the manual to KnifeST, which knows about these problems
>>and can deal with them.
>
>I have KnifeST, but not the manual -I got the program off an "ST format"
>cover disk.
>I can't say I trust KnifeST -I used it to change some file-dates and it
>crashed my harddisk! So I'm not going to do that again.

No problem with my cover disk version but with only a 100Mb hard disk
I don't have any partitions larger than 32Mb. As KnifeST is quite old
it may be larger ones that cause the confusion.

Most likely, you simply changed the wrong thing by accident. It is
quite easy to write the edit buffer back to the wrong place for
instance!

>Also, there must be a more "user friendly" way of making disks work on both
>PCs and STs -surely people can't be expected to mess around with the
>bootsectors just to make this work? (sort of ironic with one of the most
>user-friendly computers around that one should have to do this).

The fact my PC is capable of destroying a floppy leads me to a
worrying conclusion - that the differences between the dd and hd
mechanisms must be playing a part.

It only happens to genuine dd floppies which I attempt to format to
720K on the PC, where the format happens to fail. Thereafter the PC
refuses point blank to recognise the floppy. For example, say the
format fails half way through, an attempt to format it again will
result in the PC failing to format even the first track! There should
be no reason for this thus it would be reasonable (but not conclusive)
to say this is probably a logical problem. Attempting to format it on
the Atari afterward produces the same result but in this case I think
the problem is physical, simply because in many cases the Atari had
just formatted the disk before it went into the PC for formatting and
got destroyed.

On the other hand, if a format of a hd disk (to 720K of course) on the
PC happens to fail (rare) then an attempt to format it with the atari
will still fail as above but the PC will reformat it (but still states
the media is unusable until such time as a format succeeds).

Once either type of disk has been formatted both machines can read and
write data without problem. However, anything formatted by the PC
tends to be unreliable over time.

Finally, formatting a dd disk on the atari then having the atari stamp
it with the bootsector from a valid PC disk produces a floppy which is
totally reliable on both machines.

Reading between the lines it begs an obvious question. What is the
difference between a double density floppy mechanism when formatting
and that of the high density mechanism when formatting?

>>dedicated backup programs!
>>
> But STZIP is so damn slow!

Set it so it just stores rather than compressing. Where you've got
lots of little files in comparison with the cluster size you still get
a massive effective compression. ;-)

[and you can always compress the resultant zip again if you want]

>And for some reason I haven't figured out
> yet, lzh shell get confused and cant find some file its writing to, and
> dies in the middle.

Check the temporary file path it is using (same for StZip as well
actually). Ideally you want to set it to a partition which has a lot
of space on it - iirc both programs compress to this temp file then
copy it over to whatever name you specified for the zipfile, on
success. Thus you need enough space for the compressed file on the
destination partition plus the same space for the temp file, wherever
that is.

No, but there is a simple file splitting/joining utility called
SPLITTER available on ftp.

I've also rewritten it as a proper Gem program which I can email you
if you want to try it. Consider it a beta as it hasn't been tested as
much as I'd like.

>I got into the ISP,(maybe) and then dropped sting

Dropped Sting? Hmm, I hope that doesn't mean what it ought to (that
you disconnected or disabled it). You should connect with Sting and
leave it running / enabled, then run Newsie.

>and ran newsie and all it
>could give me was some message about failing to resuovl DNS.

Leave Newsie out of it for the moment. It's an added complication you
don't need just now. Just connect with Sting then see if it resolves
an address using the tools built into the dialer. ie TOOLS->Resolve
and type in the name of something. My address will do because it is
unique: swampdog.demon.co.uk, does it return 158.152.224.11?

If yes then you're almost home!

If "no" then TOOLS->TraceRoute and enter 158.152.224.11 and see if you
get a list of things. If nothing happens then something fundamental is
still wrong with the Sting configuration. If you do get a list of
things appearing then triplecheck with your ISP that the value you
have set for the NAMESERVER variable is correct, because it almost
certainly is not correct! Otherwise TOOLS->TraceRoute
swampdog.demon.co.uk would give you the same list as TOOLS->TraceRoute
158.152.224.11 does. (Tell the ISP that NAMESERVER is the "DNS server
address"). If you are still suspicious then change the NAMESERVER
value to 158.152.1.58 or 158.152.1.43 and try again (you'll need to
disconnect, reboot and reconnect when changing NAMERVER). If either of
those values work then your ISP has *definately* not told you the

correct value for their DNS server.

>And I can't find anyway to use the cab2demo I've got, it's even more
>confusing.

Again, forget it. If you can get Sting to Ping, Resolve and TraceRoute
then you're almost home and dry.

What if you're writing two filenames. One is longfilename1.ext and the other
is longfilename2.ext. If long filenames are not supported, then the second
file is going to overwrite the first file, because both will come out as
LONGFILE.EXT.

Yes, doing batches of folders seems to work. It would be nice
however, to set it for one big backup and walk away. It is starting
to look like this is not a realistic possibility.

George,

On my FirstWord disks are the following Epson drivers:

EX800,FX80,FX800,GQ350,GQ500,JX80,LQ80,LQ800,LX800,SQLQ50. When I use FirsWord and my Epson Stylus PRO, I use the LX800 driver with no problem. If his printer has an "Epson" compatable switch then one of the drivers should work.

Hi all!

Does anyone know of a program that will handle stereo pictures for use with
LCD shutter glasses, which will produce left and right images sequentially??

Still images are what we would like to display and/or produce. Does anyone
know where we could source the glasses etc?

This is a project for the Cheshunt Computer Club.

Cheers!

James (for Cheshunt Computer Club)

Source record: 102570

I would seriously recommend that any user of STiK/STinG and CAB 1.5 or later get the latest version of Dan Ackerman's CAB.OVL (v 1.2904). There are two versions (again) - one for 6800 machines and a 68030 version. Timeouts are gone (unless there really is a slowdown on the "net"), overall download speed of pages really flies, and pages that were once not accessable or only partly downloaded now come across fine. Even my problem page (www.maseratinet.com) is completely accessable :).

Go DAN!! (and that shareware fee is on its way <VGB>)

Maybe it has something to do with the particular port-fix (HSMODEMx,
Fast serial etc.) and their settings. e.g with HSMODEM on Serial 2 you
have to set LANBIT. There may be other things like this.

It may be using an uninitialised/corrupted file-handle. Or, perhaps,
picking up some store dynamically and not initialising the contents?

I think it's written in C which is not a very useful language for
store protection etc.

Parx has recently gone bankrupt, so none of their products are
commercially available anymore. There are probably discussions as to who
might resume distribution, but for the moment nothing.

Well, the good old "Cyber" 3D package is capable of rendering to and
displaying such images. I believe it works with some do-it-yourself
interface to attach one of those LCD-glasses. Unfortunately, I have no
experience with it myself.

: This is a project for the Cheshunt Computer Club.

Well, good luck, and keep us posted !

Hi Peter,

you'd better said: "Cheer up!"...

Good lawd once more, and I have said "I'm sorry having called Newsie a
screwball"...

Well, for one thing: I'm definitely NOT going to try again to let Newsie
eventually corrupt more data by figuring out what's going to happen when I put
in again the original Cache.dns file... NO WAY!!!

Heck, this scares me... and once more I learned something. BTW, will this
possible corruption go beyond my C-partition where Newsie and Sting are? I've

got 2 HD's, altogether 8 partitions with a total of 1.7 Gb hooked up to my TT!

I figure there's more people now reading with bleak cheeks (Hi, Petter!)...

And finally, there's one more yelling to go:

JOHN, try to fix this problem ASAP!!!!!

Bonjour Pascal,

gimme some time, I'll put it on my web page... Haven't heard from Boris yet about a complete version on his site. I've got this Insignia.zip already on my page (the files needed to get the FSA drive working) and I'm gonna put the other stuff there too shortly. Still working on a better "manual" than the notes supplied with it...

As I understand from Boris, Insignia gave him a written permission to put it available to any public site.

DOS will NOT be included, tho' :-)

The whole of the German text has been translated into English by the combined efforts of Mick Lock and Peter West - the result can be found on my Web page www.cix.co.uk/~derryck/software.htm and has been hatched into FANfiles on the BBS network.

Harun has given his blessing to this endeavour.

Keep a lookout for Everest, now that you have Newsie up and running you
could surf to http://www.cix.co.uk/~inactive/ and grab the latest English
version from the UK reg. site.

There's no need to call the text file anything, Newsie will call the editor
with a default filename which it will rename itself later.

: Is there any software emulating a FPU that catches the Line-F calls and acts like
: a (slow) FPU? I know there is some thing like that for Linux, but for Tos usage?

Linux 68k currently uses some code from FreeBSD, thoughit's not in the
official source distribution because the BSD liscense and the GNU liscense
are not 100% compatible. My guess is that with some modifications for the
lowlevel stuff the FreeBSD could be adapted for TOS as well, although most
TOS programs don't rely on an FPU...
The code used in Linux/BSD can be found in the Linux 68k FPU-emulation code
patch on the NoCrew FTP site.

My Falcon030 has a detached keyboard, is the chip inside the
keyboard of in the cpu case? and wouldn't a new battery do
the job? Just wondering, mine is still going strong.

I'm using 1.15 too, and that slider is set at 10, I don't
know anything about how the transfers are done, but I have
my newsie settings for only 25 messages at a time for the
newsgroups and even then it can take up to an hour to get
them.

>run memory test, etc...) Does anyone know if this is a hardware problem
>that can be rectified, or some strange software issue?

This is definitely a hardware problem.
You'll have to exchange the RTC-chip, which contains the backup-battery. The IC-number on the motherboard is U64, located roughly in the middle of the PCB and close to the front edge of it. The chip is a "Dallas DS1287", a chip that should be available in any store that sell electronic components.

Good luck and best regards,

Hi all,
I found ICD Inc.'s web page awhile ago, and they had an online order
form for soem of their Atari stuff. I ordered two golden image trackballs
and a mouse/joystick changer from them, but I've heard not a peep in about
a month (I emailed them again, asking if anything had been done).
Are the pages just up, with no company behind them, or is it worth my
time to bother them again?

If not, can someone tell me where to find a good ST/Amiga switchable mouse
so I can pick up a few? I had to lend a really nice ST/Amiga switchable mouse
to my friend for his A4000 so now I have none for my 1040STf <sniff>.

thanks,
-Russ Magee

Yes, it is weird, isn't it? When I boot without Sting, it never
happens (by an inactive Sting I was refering to the button in the
Sting internals cpx).
Anyway, I don't worry too much about it. I haven't seen any other file
affected by the bug and it doesn't interfere with my online
activities. I've been using Newsie since it's "childhood" and I still
think it's great!

There is an auto folder program called magcufsl.prg which registers
MagiC's internal font selector via UFSL so most programs pick it up.
Less than 4k. No idea where I got it from, though - my guess would be
a magazine cover disc. If you can't find it using Archie or similar let
me know and I'll see if I can find out more.

I'm entirely in agreement with Emmanuel. The program sounds WONDERFUL,
and I would pay a shareware registration for such a beast. But only if
it's a GEM legal program that runs under MagiC and other modern
operating systems. If you made it a GEM program then the screen rez
wouldn't matter as long as the dialogs weren't too big for med rez.

Not using GEM is fine for games I guess but considering the number of
variations in hardware etc currently available hard-wiring it for
single-tasking med rez on fixed hardware is daft for a serious
program.

If you really can't stand the idea of using GEM, you'd be better
making it a text-based TOS or TTP program.

Just my tuppence-worth...

There are ready-made 'shoe-boxes' which plug into the 'Harddrive'
(DMA) port. Made by Supra, ICD, Gasteiner etc.

They contain a host adapter board (DMA->SCSI), a SCSI drive and a
power supply and are quite easy to make yourself if you can find the
parts. The rarest part is the host adapter. The one on the market at
the moment is the Link97 but you may find others (ICD, Supra etc.)
second-hand.

>HD anyway? Is there another connection needed that I don't know about?

For a HD to be usable a hard disc driver needs to be loaded. Unless
the previous user wiped the Supra clean I would have thought it would
have a driver installed on C:

Try:
Switch on HD, allow to come up to speed.
Switch on ST. Watch the activity light on the Supra. You ought to see
something going on for about a second.
Using the ST Desktop do 'Install Drive' and name it C (upper case)
Double click on the resulting icon. If it opens a display then install
D, E , F etc. until you get 'Invalid Drive' when you try to open one.
Save the desktop.

If this does not work either the drive is broken or there is no driver
installed. You will need to beg/borrow/download some driver software,
Supra has some kit as PD but any will do. Load the driver s/w from the
floppy and the HD should be recognised. Install the driver on the hd
using the utility supplied. Run the partition program to find out how
it is split and install the appropriate icons on the desktop. Save the
desktop.

1697. HELP!! Falcon Electronics Guru Please!

Newsgroup: comp.sys.atari.st
Date: 1998-04-24 00:00:00 UTC
From: Chris Whitelock <chrisw@newton.dialix.com.au>
Message-ID: <893411068.863003@newton.dialix.com.au>
Source record: 102411

Help! I have managed to damage something on my Falcon motherboard
as a consequence of plugging in a SCSI cable I bought locally.

There was a smell of burning and the (totally standard) Falcon can
no longer recognise ANY drives (floppy or hard).

I _believe_ the problem is that the cable took SCSI pins 11 and 38 to
GND whereas they are +5V according to the pinouts in the Falcon manual.

It looks as though diode "D5" has blown, which I am trying to replace.
Also, the right-most pin on component "P2" (I think) is in the middle of
a blackened hole on the motherboard (P2 says B221/331G on it).

I still get +5V at the SCSI port, and no tracks appear broken.

There is probably no-one in Western Australia with the knowledge to
identify and correct anything Falcon-specific...

ANY HELP APPRECIATED, PLEASE!
Email me if possible please as I have to access the 'net through borrowed
machines and my ISP clears the newsgroups out very frequently.

Thanks in advance...

Hi.salut
I just read an article in a local computer paper talking about a
Canadian company (Northern telecom) that is working with Nor.web
to bring the capability of sending electronic data over *electrical*
power
lines, to Europe, 10x faster than ISDN! Starting in Hanover, Germany. No
more metering or paying per minute? Does anyone know
of this company? or has heard of this capability(DPL 1000)?
apparently shown at CeBit?
(March 18, 1998 at the CeBIT ï¿½98 exhibition in Hannover, Germany)
http://www.nortel.com/broadband/news/1998a/3_18_9898121_norweb.html
or go to www.nortel.com and do a search on DPL 1000
Also this service was to have been introduced in England
last October? (United Utilities PLC)
to quote
"Multiple applications via DPL will support high speed Internet access,
telephony (IP voice), multimedia, smart applications/remote control,
home
automation and security, home banking/shopping, data back-up,information
services, telecommuting, entertainment, etc.Digital Powerline offers a
better, simpler and faster connectivity in which education, business,
the
home, community and commerce can all benefit."
Other European companies are Norweb Communications of the UK, Vattenfall
and Sydkraft of Sweden, RWE and EnBW of Germany, Singapore Power, and
EDON of the Netherlands.
one concern I would have is the potential for the invasion of privacy,
and control of household electrical machines.
but it sounds pretty interesting!

Knowing how much money Europeans pay for phone access, this may prove to
be _much_ cheaper! :)

Hello,

Dans l'article <3545f522.43962869@news.zetnet.co.uk>,
Tony Greenwood, <paxton@zetnet.co.uk> a ?crit :

??>> Please NO, or it won't work on Hades, Milan and all other new atari
??>>clones like that.
??
??>I'm entirely in agreement with Emmanuel. The program sounds WONDERFUL,

Thanks.

??>it's a GEM legal program that runs under MagiC and other modern
??>operating systems. If you made it a GEM program then the screen rez
??>wouldn't matter as long as the dialogs weren't too big for med rez.
??
??I am supporting All ST's including Megas, and Falcons and TT.. I think
??I got the majority ? I agree some wont be supported such as
??multitasking and hades?...

Why the ? If you hardcode medium rez only, it's certain it won't work
on hades, nor on any coming atari-compatible computer. There's no way to have
minus than 640?480 with the cards in it.
Let's be serious : if one needs that programm, that means one handle a
huge Web site, no ? Don't you think these machines are really more suited for
that than ST & Mega ST?? So why not support them?? I can't see any reason, for
such a programm, to hardcode a medium resolution.

? but hell what program is compatible with
??everything from a half meg floppy fm right up to those machines... not
??much I can tell you.....

So why add some more incompatible programms ?

??>If you really can't stand the idea of using GEM, you'd be better
??
??eerm Its not by choice.. what makes you think i don't like the idea?

What is the reason to avoid GEM??

??>Just my tuppence-worth...
??
??Unfortunatly the original post was looking for beta testers.. but all
??it has produced thus for is ...hmm well..... makes ya wonder if its
??all worth it eh ?:(

I can't be a beta tester if I can't run it on my computer, even if I
would be interested by the program.
In another way : first bug report, ��doesn't work on hades��.

And you were also asking for comments... You had comments.

I may seem angry... I'm a little : i don't like when a programm
doesn't work on my computer, but I really HATE when a programm is made to NOT
work on it for some strange, unjustified reasons.

Is the STBook actually the same as the STacy? Does it run most ST software (I'm mainly interested in Cubase, Notator, Avalon, and some others)? What's the screen like to actually use?
Anyway, if it will do all of that I'm interested in one. I have a Mega ST2 with mono monitor to trade towards it and may have a Mega ST4 w/MegaFile 30 the week after next. Let me know...

Hi all again,

OK, just one more, to keep the newsserver sweating :-)

I hooked up to this NG early in February by means of the Fido gated echo.
So this means I've been closely following this NG for about 3 months now.

During the time I read the Fido-gated echo (and I still do, but will disconnect it soon) I came across lotsa messages from one character called Cosmo Roadkill, and all these articles only said "article cancelled, exceeding BI of....." something like that.
Now since I've been hooked up to the NG directly, I can't recall having seen any of these postings in my overview window, whereas they still occasionally turn up in my message reader for Fido.
What am I missing here? Who's this "Cosmo Roadkill" and why doesn't the postings show up here as they do in Fido (but are wiped out too)?

(Am I slamming the button "DON'T TOUCH!" now?????) Heck, just curious...

Message-ID: <893437204.3084.0.spot.c3adfca1@news.demon.nl>
Source record: 102422

Hi all,

(first of, my newsserver appears to be hardly working, after the morning session only my own postings rolled back in. Received an email from my ISP they expect to have problems until saturday afternoon... complete capacity seems to have been taken up and they ordered a second one with twice the capacity, delivery is set for late May...)

Right, i've got quite some "moving GIF's" around here and I'm just wondering if there's any decent program being able to show all the frames of them.

OK, I can put them in a HTM file and show them in CAB, but that's the looooonngg route. I know M-Player handles them too, but this program doesn't wish to work with a Matrix card...
When I view these GIF's in Gemvieuw/Graftool they show only frame nr. 1...
Would be nice to have a small tool where I can view these quickly.

Also, I found new kinda files called .ASI these appear to be GIF89a type moving GIF's as well. Renamed them to .GIF and they work the same way. Anything special on this ASI file extender?

t>
t> Where did you find v3.6? I've v3.5.

I found an upgrade patch from an Internet FTP site along with patches for
Diamond Edge up to 2.04, but I no longer remember where I found it B^{<

I suspect it was ftp.cnam.fr/pub/Atari/Disk/ but I guess that no longer
exists. Where did cnam get relocated? It's not in Hallvard's FTP list.

t> What are the differents between v3.5 and v3.6?

This information was always hard to come by and I don't think I ever saw it
anywhere. Usually the upgrades were related to Tape ackup devices.

The accompanying readme was as follows:

```
================================================================================
Diamond Back 3 Version 3.60 Patch
October 3, 1995
-------------------------------

This program will patch Diamond Back 3 V3.50 or 3.51 to version 3.60. Place
DB3PATCH.PRG and DB360PAT.DAT in your DB3 directory and double click on
DB3PATCH.PRG to apply the patch.

If you have any difficulties applying this patch you may return your original
disk and $5 and we will be happy to remaster your disk.

If you have a version of Diamond Back 3 before 3.50 you may obtain the
upgrade to V3.60 for $10 + $2 S&H If you want a new manual explaining all of
the new features in 3.5-3.60 it is an additional $5.

Oregon Research
16200 S.W. Pacific Hwy., Suite 162
Tigard, OR 97224

PH: (503) 620-4919
FAX: (503) 624-2940

> Connect: news.ptw.com
>
> open_connection returns DNS query, can't resolve hostname.
> --

You're sure you're using the right NAMESERVER entry for your ISP and have set
up the correctly named NewsServer in Newsie?

The information I've been given to use is as follows:

Primary DNS: 194.153.0.18
Secondary DNS: 194.153.1.10 (if required)

These, I have put in the Nameserver lines in both DEFAULT.CFG and DIAL.SCR

News Server (NNTP): news.compulink.co.uk
Mail Server (POP3/SMTP):mail.compulink.co.uk

These, I've converted to the following statements in DEFAULT.CFG. is this
comparale to what you have set up in your STinG configuration?

SMPT_HOST = mail.compulink.co.uk
SMTP_SERVER = mail.compulink.co.uk
NNTP_SERVER = news.compulink.co.uk

> BTW, everytime I run Newsie, it shows all the pathways, which have
> remained the same, does it do that all the time?

Err.. what? I hae no idea what you mean by this. Can you explain what you
mean?

c>
c> No, don't have that option :^(

Oh dear...

>> What version is ezBack or what date is the program file? Maybe this
>> is one of the limitations of the light version
c> (I'm talking about ezBack v1.00.)

Ok. I thought it might have a version number that was equivalent to the full
version...

>> but if it's advertised that it's possible to back up to a ZIP drive,
>> then some option must be available...
c> Still I wonder why ezBack is in the ZipJazTool-pakage as you can only
c> use it to backup FROM your zipdisk and not TO (as they suggest in the
c> readme). It doesn't make the pakage more usefull.

It certainly doesn't B^{<

c> The ZipTools itself offer the same extra's as HDDriver does
c> (regarding Zipdrives), like using passwords, remote eject, formatting
c> etc. The bonus utillities don't work under MagiC (a floppy-formatting
c> and a file-search tool) and together with ezBack they offer not much
c> interresting for zipdrives.

HDDriver started supporting the extra Zip features very quickly, so you're
right that you don't have much of interest there...

c> OK, thanks Harry. I think I'l have to look out for a decent backup
c> program then.

The full Diamond Back utility is availale from HiSoft in the UK (v3.51 when I
got mine, with the 3.60 patch available somewhere on the internet, but I sent
HiSoft a copy of it, so maye they're supplying the latest version nowadays).
There's also Vault (and Key) and Turtle (and unturtle) in PD/SW.

r> Positive Image and perhaps get some compatibility feedback from
r> another NOVA user.

For me, Byte Aligned works in 256 colours, but I switch to VDI for 15-bit colour (32k) and then oer to Crazy Dots 65536 for 65k mode. It's important to save the right settings in each colour mode, because the preferences used will be retained depending on the colour depth you're in.

Yes, Crazy Dots 32768 doesn't work on a Crazy Dots 2 board in 32k colours! I think this might be meant for those who have a Crazy Dots 1 oard (max 32k colours).

Ok.

>> The result in SERIAL CPX was to report Modem 1 @ 9600baud B^{<
PR>
PR> Sounds as if you had not saved the wanted serial configuration after
PR> your modified setup?

No, that's not the case. I've just tried it again with a saved setup and
again, with and without HSModem.

Without HSModem I get Modem 1 @ 9600.

With HSmodem I get Modem 1 @ 19200

B^{<

PR> Unfortunately, under certain circumstances HSMODEM shuffles the bios

PR> bit ;-)

Fair enough. Just be sure to send the UUEd file to me at the
sidcelery@cix.compulink.co.uk address, as this address I'm posting from
forbids transfer of all UUE files - the software scans messages for UUEd
files and deletes them!

Alternatively I can collect from your Web site...

I know that - it's just the English releases I'm concerned about. It's
pretty clear that 2.5 is not a very good ersion in comparison with the
updates, but it's fine for me atm because of STinG in place of IConnect and
I'll wait for a stable package before trying IConnect again.

Boris,

My point is that on a platform to platform basis STZip is as or more
efficient at compression (both packing and time) as WinZip on the pc.
One can also configure STZip for more speed by changing the parameters
in the config section of the program.

Steve

HT> "[Internal] [Cancel]"

Here's the catch...
QED can only use the universal fontselector (UFSL) or the extended universal
fontselector(XFSL) as provided by HuGo or Calvino; both are TSR's.

THING however provides its fontselector via the so called 'Font-Protocol' by
Christian Grunenberg.

The first is a programming interface, the latter is sort of an extended
system-call.

If you're using long names try using the TTP version of LZH. It will
compress complete partitions and retain the LFN. It works with VFAT,
although I don't know if it does with MINIX.

Best to set it so the free space on the temp is around half of the size of
the files you're compressing.

There is a zip splitter and fixer (sort of) written in GFA basic. AFAIK it
'fixes' a zip by seperating each compressed file and making it into another
zip.

I have two or three 8-bit Ataris (its been so long since I've messed with them I don't even remember how many) I think an 800 and 2-1050s? and a 1300 are those the right numbers (1050 sounds like the disk drive number) I also have 1 or 2 of the double sided disk drives and 1 or 2 Indus GT drives, I have a 1mb Ram drive an Epson printer I was running Sparta DOS and I think I also have some other DOS (as well as Atari DOS). I have bunches of software (I used to redistribute shareware) most of the Antic Atari books and also Antic and Atari Connection magazines from the era of the 8-bits popularity if anyone is interested in obtaining any or all of this stuff let me know and I can find out more exactly what I have and you can make me an offer. Hi Everyone.

I have a 1040st system that I want to sell. I never use it.

System is in great condition and working state is guaranteed.

1040st.
atari monitor.
external 3.5 floppy.
2400 baud modem.
mouse, joystick
a few games and programs, manuals, etc.

Please make an offer, plus shipping.

Thank You.

Atari themselves marketed several external hard drives for the ST series of computers, including the MegaFile20 (20mb), Megafile30 (30mb), Megafile60 (you should be able to figure out the size of this on by now ;-), and Megafile44 reomvable (which was a Syquest 44mb removable platter system). All of those plugged directly into the "Harddrive" (or "ACSI") port.

You can also connect most any external SCSI hard drive by using an ICD Link host adapter which connects between the SCSI drive and the ACSI port. There were also several 'internal' type SCSI host adapter interfaces which were designed for use within an external hard drive case to allow connection to the ST series.

You could probably persuade one to work.

>How about, on a single-drive floppy-only system?

The commercial but long defunkt Mark Williams C (MWC) compiler would work like this provided you had at least 1 meg of ram or (iirc) 1/2 meg of ram and twin floppies.

>Any recommendations? Sounds like Sozobon is the freeware compiler of
>choice, but it looks pretty big to me.

Wait until you've purchased a hard drive. Here's why ...

My first atari was a 1 meg STFM with twin floppies and I bought MWC at the same time. MWC has a command line option that causes the compiler to pause between phases so that you can insert the next floppy. This would put you off learning C for good simply because it took so long to compile. Never mind trying to debug something!

The other option was to have a decent sized ram disk installed. This was much more agreeable but ...

If you put your program on the ram disk it compiled dead fast but if the program crashed you'd often as not lose the ram disk. Aside from having to recreate the ram disk and its contents which took time (even with a dedicated MWC option to do this) you'd also have lost your source code, and Sod's Law would always dictate there had been major changes to it since it had last been saved to floppy.

You could of course work with the source file on a floppy but again compilation slowed to a crawl and the floppy drive heads would really get hammered. Not something they are really designed for.

Finally, whatever compiler system you manage to persuade to run on a floppy only system is going to be crippled. The errors arising from these "config" problems alone could put you off wanting to pursue learning C.

> b. I've come across assembly-language tutorials; I'm sure there are
>C programming tutorials for the ST. Old versions of ICTARI? How about
>details on the system calls?

They can be found. However, when learning C the last thing you need to be doing is fiddling about with things concerning the machine it is running on. Just learn C for which any decent general purpose book will do. Once you're comfortable with it then move into areas concerning the machine itself such as hardware and Gem etc.

That's the doom and gloom out of the way! You mention a zip drive and the Link? This leads me to conclude it's a scsi device currently on another machine. Although no substitute for the real thing, there are emulators for unix, the Mac and the PC. Using one of these could well allow you to install a complete compiler system and begin development now, migrating across to the ST when you purchase the link.

>: Huh ? ST-Guide is *very* stable on all machines I know of. Are you using
>: TOS 1.0
>
>The problem appears to be Tos 1.0

Ah. This is about the only Tos version out of the multitude (many os replacements (emulators even?) included in said multitude) which could not feasibly be supported.

You have two realistic choices.

Either use a replacement operating system like MagiC which completely replaces the roms (the roms are used just long enough to boot MagiC then MagiC takes over). For this you will need a fair bit of ram because that's where MagiC sits. 2 meg min, 4 meg recommended. MagiC is commercial.

Or, get hold of some replacement roms. You can buy them but I've found from experience here in Nottingham that obtaining parts is pretty straight forward. Just place an ad in your local free paper asking for broken machines. People part with them for next to nothing (even nothing sometimes). All you have to do is make sure you get a machine which has the same number of rom chips as your working machine.

Alternatively, cannabilise your machine to get the broken one working. Typical broken machines have nothing more than ...

a) Broken keyboards.
b) Duff power supplies.
c) Mangled floppy drives.
d) Kiddy abused connectors.

All the above parts are interchangeable between STF(M) and STE machines. Only (d) requires soldering, (a..c) are plug 'n' pray! ;-)))

Don't worry. Sting is Stik compatible so, as to not confuse older
software it sez it is Stik.

>but before that it says 'No AVSERVER found' what the heck is
>that?

Nothing to worry about as far as your online problems are concerned.

>and everytime I try to have newsie connect, if I have the
>news server as 'news.ptw.com' I get the above statement. But if I
>change it to 207.212.176.3 the ISP's DNS number, then it just times
>out and no connection.

If 207.212.176.3 is *really* your ISP's DNS server then you ought to
find that NAMESERVER variable and put ...

NAMESERVER = 207.212.176.3

... there. It should now be able to return a dotted quad for
news.ptw.com. Even if Newsie can't then Sting will be able to (Try
TOOLS->Resolve news.ptw.com which should return some other dotted
quad). If Sting can, and Newsie can't then Sting is almost certainly

working and you've just got a config problem in Newsie. ie you're nearly home and dry! :-))

Aside from the NAMESERVER thing, you'll need to ask your ISP if they
can change this CHAP protocol to something else. I can't believe that
this is impossible because CHAP is rare iirc.

<102063.112@CompuServe.COM> wrote:

>NAMESERVER =
^^^^^^^^^^^^^^

This is absolutely *critical*. Ask your ISP what the address is for
their "DNS server". ie this is the machine which when given a name
like www.yahoo.com will return a numeric value like 123.456.789.012 or
whatever its numeric value happens to be. The numeric value is
technically known as a "dotted quad". NAMESERVER must be a dotted
quad. In case my other response hasn't got through yet and your ISP
hasn't given it to you try setting it to NAMERSERVER =158.152.1.58
which is one of my ISP's DNS servers.

[as long as the rules have not changed recently then it will work but
because it'll be wandering across to the UK for every address it will
be darn slow. However, if it works then you've found your problem]

>Also, how do I read HYP files? Nothing that I have will read it.

ST-GUIDE

Hmm - PETER!!!! Shouldn't there be a PROTOCOL to set PPP somewhere or
is it obsolete now?

>When looking through this group I come across messages that have line through them, what does this mean?,

Depends on your newsreader I would guess.

>does this mean that the author has cancelled the posting because they no longer wants a reply?,

It probably means ...

a)
it has been cancelled because some higher authority did it, like your ISP or whoever is in charge of the newsgroup.

or b)
that the posting has simply expired. They are only kept for so long.

>if so how do you cancel an posting?.

I dunno. It is (iirc) possible to cancel a usenet posting with a suitable command to somewhere but if you did it to anything other than your own then it would most likely be enough of a serious breach of "netiquette" to find your account terminated, unless you could justify issuing the cancel.

>Also I notice that some postings are cross posted to other newsgroups,
>how does this newsgroup know that it has been cross posted?

This newsgroup (taken as an enitity unto itself) does not know. Each posting in any newsgroup has a header (which can be viewed by you if suitable options are selected). The information about where it has been posted is in there. The newsreader in use is free to make of it what it will. Typically, PC readers are bt default moronic and post a reply to all newsgroups (but can be told not to). Hence the garbage that appears seemingly out of context sometimes.

The "internet" only guarantees that the lower 7 bits of a byte will
get transmitted intact, thus characters with a value over 127 may get
corrupted.

Additionally, various stages involved in the transmission of your
information may be at liberty to truncate any lines longer than a
certain value (which I can't remember offhand).

>Help!

Use an encoder program. You may have heard of MIME which is common on
the PC for instance. More common on the atari is UU-encoding. This is
available on PC's and Macs as well of course, just not the default
used by them.

yg> the AV-protocol and is shareware (or freeware)?
yg> If in addition it copes with long filenames and it is not in german,
yg> that's all the better!

Do you use Magic 4 or higher, Yves? If so then you can add the freeware utility AVSERVER v1.1 from Alexander Barton (author of the replacement Shutdown-for-Magic v1.6) which acts as an external AV-Server and FontServer as long as you define it in MAGX.INF and start it in your AUTO/APPS folder.

AVSERER will only work with MagxDesk - no other Desktop...

This may be a better solution than using Thing if you are struggling to keep as much free RAM as possible.

Just an idea...

Martin,

Don't be to sure that you were the only one having problems - I had a somewhat similar incident with my ISP about a year ago with their news server (reqired a password for log on) and it was screwing up a lot of people. However, only three users called about it - myself and two unix box people. It seems we were the only ones who were convinced that it was not our systems that were the problem, but the ISP. It took awhile, but they finally changed their news server and (get this) E-mailed an apology to all users about what had been going on.

You could try the shareware version of CAB (Crystal Atari
Browser). This version (v1.5) is available from:

http://www.flinny.demon.co.uk

The newer versions of CAB are now commercial. The latest
commercial version available I think is v2.6

Hope this helps.

Regards,

Ben Hills.

You can plug in any Atari Hard Drive, such as the old Megafile 20, 30,
60 or 44 (syquest), or SH204 or 205. Otherwise you can use the HD port
for a SCSI host adaptor, which will allow you to use any external SCSI
drive.

Is Thing taking so much memory? For now, I use TOS and I intend to use
Gemini.
Actually, I try to keep memory (4Mo is the best I can on my old 520STE)
and money also, since I don't have a lot and can't convince myself to
use it on this so old STE...
But to be honest, I didn't even asked the price of Magic. Anyhow, I
expect it to take quite a lot of memory (even if less than Thing).

There shouldn't be. I don't think there is any "translating from VGA to
ST High", in any case that shouldn't be taking 10% of the CPU speed
away. Besides, the same problem occurs when running in VGA, even worse
(~87%)

Someone told me about a solderpad (U47) that affects ROM wait-state. He
said that he had the same problem, and when he connected these on his
Falcon, it went back up to 101%.

Does anybody know about this ? Any drawbacks ? What is this wait-state
for ?

Fortunately, there's no Netscape for Atari (pretty scary to imagine what
a 20Mb executable file would do on an ST), but there are several web
browsers available.

- STiNG+CAB
Get the packages seperately from:
STiNG (TCP/IP stack and PPP dialer)
http://www.stud.uni-hannover.de/~perot/index-e.html
CAB (HTML Browser)
http://www.student.informatik.th-darmstadt.de/~aclauss/cab_e.html
CAB.OVL (Internet connection for CAB)
http://www.netset.com/~baldrick/ovl.html

- WENSuite
A demo version (no graphics, no news/mail), works pretty well with a
plain ST on which you won't want to view graphics anyway. It includes
it's own TCP/IP stack.
http://wwwusers.imaginet.fr/~oxo/

- Draconis/Adamas
Still in beta, and not recommendable at the moment
http://dc2.uni-bielefeld.de/atari/edracon.htm

It seems you are french, aren't you? (I am) If so, then Peritel is the answer.
Yes! That's all there is to it!

Hum... Let's be honest, now. Some manufacturers sell "peritels" (don't know that word in english) with only what's needed for VCRs (magnetoscope). Here's the problem:
You will need a FULL-featured peritel, which includes R wire, G wire and B wire. Take care and ensure that your peritel is OK where RGB are concerned...

If I can put my hand on the docs I have on the peritel, I will send some info on the exact location of all wires.

Hope this helps,

Yves.

Well, I admit I haven't actually tried it, bu the last I heard of it
there were still some very blatant bugs. If they've been fixed in the
latest release, then that's great.

Cheers,
Nick

Hi! Sadly, i am having to sell my atari hardware & software.

here is what is available:-

Atari 520 STFM with 1MB memory & Autoswitch Overscan card.

Also External floppy drive.

Star LC20 Dotmatrix printer, excellent condition

Trust VGA mono monitor converted for use with atari hi res mode.

Alpha Data mono hand held scanner, with original Touch Up Software

Protext Version 6.5 (Full software with original box and manuals, excellent for word processing)

Loads of games, including Frontier: Elite II

Also 80+ Atari magazines & coverdisks.

Cost:- 200UKP or nearest offer

Contact:- Brian Innes, e-mail ceebti@cee.hw.ac.uk

Tel:- 0131 443 4226 (Edinburgh)

Hello,

Dans l'article <354b62b8.6475486@news.zetnet.co.uk>,
Tony Greenwood, <paxton@zetnet.co.uk> a ?crit :

??The finished program will work on All ST, STF, STFM's, STe, Mega and
??Mega STe's, Falcons and TT's, Will be hard coded to a 640x200x4 ATARI
??Medium resolution,

Please NO, or it won't work on Hades, Milan and all other new atari
clones like that.

(Sorry no mono monitor in this house) and will work
??on a minimum half meg machine, Floppy or HD supported, Multitasking
??environments will not be supported,

Sad.

Well so far I'm getting com.sys.atari.programmer, I get a no such news group for sci.astro.am! and I'm still trying for this one. I do get rec.gardens and rec.models.rockets ok. I have noted one thing, I'm not sure if it's newsie or the isp,but I have found messages from rec.gardens mixed in with the rocket group. Strange! I've never seen an F engine powered weed wacker that's running a 68030 cpu!

Hi Peter,

Yell and you'll get it.... I just happened to have a version, 10707 bytes but the date shows me 30.12.97... anyway, with this one my rates go down to 200-250 cps (now where did I leave that old 2k4 modem again?)

..talking about modems, with the prices these days I'm considering upgrading to a 56k modem: can you simply hook one up to a TT030 and get rates corresponding to the standard or does the TT have hardware limits? I'm simply not sure, hence the question.

Mediach() is the only sensible place to do it. It is possible that things are a little more subtle though. I've never looked at the Mediach() code myself but I do know that the call is made a ridiculous amount of times by the filing system, on my old Tos 1.2 system at least. If it were to go read the bootsector each time then nothing else would ever get done.

Taking into consideration the fact Mediach() has a "can't tell" return value then it is probable it does nothing more than set a flag, and that it is this flag which is used at a later stage to trigger the detection code proper. That's my guess anyway.

I would imagine it merely sets a flag which triggers a media change
check the next time the disk must be accessed anyway. This would
explain the "don't know" return value which Mediach() can return.

As me old granny used to say: "GIGO". Actually it was some lecturer yonks back ... anyway, I digress! "Garbage In Garbage Out". I'm a firm believer that the best form of error checking is where none at all is needed.

This is a "fileselector" issue - in essence a user interface problem. If you don't let long filenames loose into your application when the system doesn't support them then the problem won't arise, enabling you to use the same code for processing both types which is also easier to debug.

Hmm, I've spent ages on this response because something popped into my head. Let's say I write an application which accesses a datafile called "foo.dat" where "foo.dat" is hard wired into the program. Now I run this on an 8+3 system whereupon we get a file "FOO.DAT". Now I migrate to a long filename system. Will I end up with a new "foo.dat" plus the old "FOO.DAT" - I guess so.

>screen.

Select one of the floppy icons then "Install disk drive" then enter C:
(upper case or you'll end up with the cartridge port) then "install".
You'll then have an icon. If when clicked it comes up with something
to effect the device is not responding then you're probably lacking a
driver.

>Do I need to get a floppy boot disk, or should the ST detect the
>HD anyway?

It does but only enough to load the driver which then takes over. No
floppy boot disk is needed. You just need one with a hard disk driver
on it which you then execute from the floppy. This allows you to
access the hard disk and copy the driver across. Thereafter the
machine will boot straight off the hard disk. The hard disk
installation program will no doubt automate this process for you. I'll
leave to others to recommend drivers.

>Is there another connection needed that I don't know about?

Dunno. I'll let someone else answer.

>I've also been unable to use my floppy drive, until now I'd assumed a
>drive malfunction, but... I've tried two 3.5 SF354's: I was able to
>format one disk successfully with the first, but now ST disks won't boot

>which can be displayed or executed (of course)). Today I had the
>opportunity to try a second SF354, but kept receiving the "Drive not
>responding" message; this drive sounded *horrible*, however, with
>excessive knocking and grinding.

I once had a machine with twin drives and this started doing the same
thing but only when the external drive was plugged into the back. It

turned out the external drive's cable had been damaged. Perhaps the connector has been damaged, or a bit more likely, the internal ribbon cable has. Worth checking.

>So my second question is, are these drives simply prone to failure, or
>do both problems add up to a malfunction in the ST itself?

In ten years I have only had one internal drive fail on me, and one other which had a head failure (but it happened to be the "right" head so it still works single sided). The FDC chip is slung on the side of the DMA chip but until you figure out the hard disk this indicates nothing.

>(Completely
>clueless of me, I know, but perhaps a brief lecture on connecting the
>hardware properly is in order too.)

I'd disconnect the hard disk and check the ribbon cable for the internal drive.

>Can anyone help with either problem? I hope I don't have to re-format the
>hard drive; I'd really like to know what might be on it!

Drivers are pretty interchangeable.

>explaination of these errors

The error actually means the system has run out of file handles (too
many files open at once) which is odd because when I looked it up I
expected it to be the "invalid program load format" error code.

Unless there is a "bug/situation" that someone else knows of where
this can happen then I suppose you ought to be looking for the culprit
responsible for opening loads of files. Strange!

There was a discussion on this on csast a bit back. On the software side it was said it would be possible to drive two displays at once but the application would have to deal with one of the display areas entirely by itself. The system would deal with the other of course.

I've sat down with a two-monitor Calamus setup like you describe (in this case a Moniterm and SM124). But that's not what I'm looking to do: I just want to have two monitors _connected_ to the TT without having to unplug the TTM195's monitor cable to run the NOVA/MultiSync. You see, I simply can't run the NOVA/MultiSync when the ECL monitor is connected, even if it's powered off. To explain, the NOVA has an external box with a monitor port, so I have two monitor ports, the other one being on the TT itself. To run in NOVA/MultiSync mode, I need a switchbox to fool the TT into thinking that there's no monitor attached to its own default port. This way the NOVA drivers should boot correctly on the MultiSync. As it stands now, I have to turn everything off and unplug/plug the TTM195's monitor cable by hand.

cnam is now at *ftp.lip6.fr pub/atari* and it's on Hallvard's FTP list
DE204PAT.ZIP is still on pub/Atari/Disk/

>If you can't locate this file (DE360PAT.ZIP) or the Edge update from 2.0x to

I can't find DE360PAT.ZIP (or is it DB360PAT.ZIP?). Please send me
this patch.

Do you mean running two monitors at the same time or what?

A while ago there was a discussion in this groups about the ability to use two monitors at the same time. From what I can recall it should be possible but with some trouble to get so far.

I've worked years with two monitors connected to my TT030 not at the same time however. I just made two configurations, one for the TTM195 and one for the Crazy Dots II. With the help of a bootmanager like X-boot it's quite easy to choose which setup one will use at boot time. This means ofcourse that one must reboot to switch from monochrome to color display.

>drive this kind of application ....

This module is include in the standard Calamus SL package (col_grey.cxm, pour le Franï¿½ais col_gris.cxm). With this module one is able to view (not manipulate) a page on a second monitor. So one can to speed up the DTP process create a doc on a TTM195 and once the page is almost finished view it on a colorscreen to see how it looks in color. That's the theory. How it's works in pratice I can't tell you. Never used this option.
Maybe Jo can tell us more about as he has two monitors connected on his TT030. Hï¿½ Jo, c'est a vous maintenant.

I have a selection of Atari ST titles for sale.

This List Updated 25/4/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins
and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'
Atari 520STE Discovery Xtra Pack 5
Language Disk DE1 (ds)
Final Fight Disks DE2 & DE3 (ds)
Sim City/Escape from the Planet of the Robot Monsters (ds)
9 Lives (ds)

SPORT TYPE GAMES

World Championship Soccer (1d,ds,nb) 2
Ballistix (1d,ss) 2
Superleague Soccer (1d,ss) 2
T.V Sports Football (1d,ss,nb) 3
Vector Championship Run (1d,ss) 2
Championship Wrestling (1d,ss) 3
Top Shot = Kick Off + Extra Time. (1d,ds) 3

SIMULATIONS

ATFII (Atdvanced Tactical Fighter II) (1d,ss) 2
Lombard RAC Rally (2d,ss,nb) 2
Falcon - The Mission Disks Vol.1 (needs Falcon) (1d,ss) 3
Their Finest Hour -The Battle of Britian (2d,ds) 5

I've had another look at TOS. All mediach() does is look at what the floppy
VBL returns. As some drives, including most replacements, don't pass on the
w/p state when there isn't a disc in the drive, the VBL doesn't see the
change and so mediach() doesn't think the disc has changed, unless one of
the discs is protected and the other isn't.

This could explain the cache problems, and possibly that of pre- 1.(0)4 TOS.
However, it still doesn't answer the question of where the serial number is
checked, if it's checked. The only other place I can think that it could be
checked is in GEMDOS, but then there wouldn't be a problem with any of the
cache programs.

On top of all this, I've yet to have any serial number related problems. All
my discs are formatted by Kobold and all the numbers are the same. This is
both under Magic and TOS 1.62. The only reason I can think of as to why I
haven't is I bridged the disc-detect switch in the drive when I replaced it
several years ago. Luckily my drive had it marked, saving me the effort of
checking which output was what.
```

Back to serial numbers again. Does anyone actually know if they are used, or
is it really a myth that has yet to be dispelled?

If you're wanting to set the steprate on a (semi)permenant basis, I've a
small clock program that does it, as well as setting the time on boot-ups.
If you want I can mail it, or you can get it direct at:

http://www.my-ste.demon.co.uk/files/hdclock.lzh

It's only small (~10Kb) and sets the step to 6ms. I know it sets A: but I
can't remember if it sets B:. Just checked the source and it does. It also
turns off the keyclick, damned annoying thing.

You've not had a hard drive fail to boot yet have you? The 'boot disc' in
question is, probably, a copy of the driver as an auto-folder program, just
in case something like this happens. If that is what is meant, find a copy
of AHDI 6 and copy the program into the AUTO folder. That's the basic 'boot
disc'. If you're using another driver (HDDriver recommended) copy the .SYS
file into the auto folder, and rename it as .PRG. I've done this 4 times,
just in case...

I have QED as the text editor, found it in the CIS file sig.
Now I have another question, can I rename it qed.prg? Right
now it's qed.app.

Also I have found that I've got to do my D/L of mail and newsgroups
and then have newsie disconnect, then have sting disconnect
and the I have to hit the reset! Otherwise, if I do mail and
then read the newsgroups, if I hit followup(Why not reply?)
many times I'll get a box saying qed needs a 80x something
font and then I'll get another one saying that I should check
my paths as newsie can't find the editor!

I'm finding that I'm having to hit reset before and after I've
had a session online, otherwise my system can and does lock
up on my.

Also! Why does Newsie put postings from one newsgroup into
the folder for another one???

Yep, like today, I got a lot of Sci.astro.am postings in
the av.general newsgroup. Two days ago, I had a mess of
rec.models.rockets in rec.gardens!

I just got ahold of a Tiny Turbo (unknown clock speed, the chip is a 16 Mhz.) I remember doing one of these years ago. I don't remember where the jumper wire goes and, I seem to remember a trace to cut (although that may have been Mega specific.)f Does anyone out there have the docs? The software? I'd really appreciate the help.

Re: "Detecting long filenames", guy@swampdog.demon.co.uk scribbled the
following on 25 Apr 98 @ 21:16:23:

g> This is a "fileselector" issue - in essence a user interface
g> problem.

The file selector has nothing to do with it, because it's not involved in the
type of program I'm talking about. I'm talking about a program that reads a
data file that sometimes has long filenames that are to be exported. The
program has to convert these to 8+3 format if LFNs are not available, without
overwriting with similar names. IOW, it would convert longfilename1.ext and
longfilename2.ext to something like longfile.ext and longfile.ex0 (and
longfile.ex1, etc.), respectively.

But how does it know if LFNs are not available?

g> If you don't let long filenames loose into your application
g> when the system doesn't support them then the problem won't arise,
g> enabling you to use the same code for processing both types which is
g> also easier to debug.

This is not an option. The program has no control over the filenames being
imported (specifically, I'm talking about messages with binary files).

g> Hmm, I've spent ages on this response because something popped into
g> my head. Let's say I write an application which accesses a datafile
g> called "foo.dat" where "foo.dat" is hard wired into the program. Now
g> I run this on an 8+3 system whereupon we get a file "FOO.DAT". Now
g> I migrate to a long filename system. Will I end up with a new
g> "foo.dat" plus the old "FOO.DAT" - I guess so.

No. At least not with MagiC's VFAT. FOO.DAT will overwrite foo.dat and vice
versa. You cannot have both at the same time.

Well, this STe is running our user group BBS except when I'm using STiNG! It would seem simple enough to me (a non-programmer) to include an option in the DIALER to do the activation. Or maybe some kind C programmer could write a simple little program for me which would activate STiNG and automatically run the DIALER. (Hint, hint!) That would work! :)

Oh sh.., you never worked with a good old terminal, did you ? ;-)
Hit CTRL-Q to proceed. CTRL-S is what is called Xoff, CTRL-Q is Xon. You'll
have come across that in the serial interface setter, where you can choose
between RTS/CTS and Xon/Xoff and both and none. It's precisely this what is
meant there.

> is it obsolete now?

That is of course in DIAL.SCR. Also, DIAL.SCR contains a name server
setting too which will override the one from DEFAULT.CFG once connected.
Third, PPP is capable of retrieving the name server addresses automatically
from the ISP, if that one allows this feature, which means no explicit name
server setting is required. Nothing critical ;-)

As with most settings, the default value is a good number, that is 128 entries.
Anything beyond, say, 30, is a good number of surfing, for other services 10
entries are sufficient as the DNS query delay does not play such a significant
role. Thousands of entries simply waste memory.

It all depends on which structures inside GEMDOS are effected, but this is
very well possible ! So running a filesystem check on each of your partitions
is a good idea.

> And finally, there's one more yelling to go:
>
> JOHN, try to fix this problem ASAP!!!!!

Such a bug can be very difficult to find, and you can help John a lot by doing
systematic tests (on a backed up partition with all other partitions disabled.
They are safe if you disable them such that you cannot access them from your
applications, i.e. if they do not show up in a fileselector etc. How to disable
them depends on you hard disk driver.) to find out which part of NEWSie causes
the corruption.

The first is ok, the second isn't ;-)

Seriously, TOS 1.0 is so bug-ridden that indeed I'd say you cannot really
work with it. It is not possible to program around all it's bugs. It's
the one TOS version for which I'd advise everybody to replace it (V1.4
is probably the best bet for you).

Cancel's can be sent out by authorised persons to delete certain messages
on news servers. That's why you won't see them if you come later. A Fido
gate will take and gate the original message, then do the same with the
cancel message, but probably (due do the way Fido does things) cannot
execute the cancel, i.e. delete the original, so you'll end up seeing
both.

What is you're problem? It's pretty straightforward to set up. Make sure you have all the parameters you need from your ISP: server names, DNS servers, phone number.

The free demo version does not show graphics online, and does not handle mail & news.

Cheers,
Nick

STZip is not slow - compressing data is very processor intensive and a
6800 running at either 8 or 16 MHz is not exactly a speed burner.

If mediach() doesn't check the serial number it must be checked elsewhere -
surely it must check it! Much cache software is confused by the lack of
differentiation in serial numers on disks formatted with FCopy3, which
doesn't change serial numbers on each format...

Opinion isn't divided. WDialog in versions above 1.90 _are_ required with
all released versions of Magic for those programs that need it. Wdialog
versions 1.1x and below only use stuff that's incorporated within Magic 4 and
5.

That said, I can get a MagiC exception error if I click that peculiar
'Register' button in the Newsie Info dialog. No wonder I can't enter

d> Talking of windows, would it be possible to change the "Status"

Can this be put in the FAQ Peter... B^{)

> I have found out that at 1st bootup something is sending an ESC
> keypress to the modem!

I get this sometimes (not necessarily with my STinG setup). Dunno why...

> I bring up STinG and have to do a DISconnect before I can do anything
> else.

Sounds familiar... from the STinG FAQ:

Q: When starting up the Dialer, I always have to click `Disconnect',
before I can go on with dialing up a connection.

A: You have the modem port activated in the `STinG Port Setup' CPX, and
saved this as default configuration. This is not how it should be done.
On a modem port you use the Dialer to dial up a connection, and the
Dialer will also activate the port. The port should not be activated
in the CPX. So go back and desactivate it there, and save again.

> I have also found that when I set the STinG's serial.cpx to flow
> control of rts/cts, and even if I save it, the rts/cts setting does
> NOT stay active. When I recheck it, it's 'unknown'.

Same here. Glad I'm not alone.

However, if you run the Dialler and then, even before activating it, call up
SERIAL.CPX I think you should see that SERIAL/CPX now shows the right port
and RTS/CTS setting. It may well not show the right port speed though, which
is the problem I'm persisting in having...

> But after doing all of this, I use the sting dialer to try another
> test I make connection ... everything goes as before ... it says as

> folder?

Most editors are fine. Everest or QED are useful for Web applications in
general. Set the path in Preferences/Path Options

Glad you can hang around for a while longer B^{)

One problem is that these English docs have not been updated since HSMODA04,
which is very old now. The docs on Derryck's site are the latest for HSMODA0

o> the other is longfilename2.ext. If long filenames are not supported,
o> then the second file is going to overwrite the first file, because
o> both will come out as LONGFILE.EXT.

This issue was best explained in the LHArceng.ttp v3.12 docs (Version update
by Dirk Haun):

============================================================================
Version 3.12 junior:
- New switch -F activates the 5+3-rule for unpacking long filenames to a
Gemdos-Partition. In comparison to truncating after eight characters
you get less name-conflicts.

Examples:

Long filename without 5+3 with 5+3
------------------------------------------
tclLoadAix.C TCLLOADA.C TCLLOAIX.C
tclLoadAout.C TCLLOADA.C TCLLOOUT.C
tclLoadDl.C TCLLOADD.C TCLLODDL.C
tclLoadDl2.C TCLLOADD.C TCLLODL2.C
tclLoadDld.C TCLLOADD.C TCLLODLD.C

- New switch -O: A directly after the archive names pass/ed folder(s)
will not be more set but from the archives unpacked.
[Bad translation - original reads as follows:]
- neuer Schalter -O: Ein direkt nach dem Archivnamen ?bergebener
Ordner wird nicht mehr angelegt sondern aus dem Archiv entpackt.
- Command 'e' will not create empty folders any more.
- Command 'm' and option -d now also delete folders.
```

- Switch -D now functions as described in the Manual, i.e. files, that
are no longer in the source directory are deleted from the archives.
- "Usage"-report now reports $LINES (number of lines in the Console) and
can be aborted with 'q'.
- If the output is uncontrolled, LHARC no longer waits for a keypress.
==========

Hi Harry,

CPX is on 19200, didn't check that with the mentioned STX in, but I recall also
then the showed connect rate was 14400 bps, as it is now... I recall having
seen a connect rate of 9600 once, but I'm not sure that was while using this
new TCP STX. ATM everything is 100%, using the STX from 1.08, I've got the new
CAB.OVL from Dan's page as well and now CAB runs better... those time-out's
have gone here too...!

No, it don't works either with the Crazy Dots 1 ... wrong palette !
And no the CD 1 without 32k expansion module only support 256 colors
modes ... with module it goes up to 32k not 65k ... I believed that
until last days when I was talking to Peter Toneff who owns the
module user manual ... so, now, my Crazy Dots page has been updated:

1825. TTM195 and NOVA

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <6hsfet$kq3@thoth.portal.ca>
Source record: 102360

Is it possible to run two monitors on a NOVA-equipped TT? The NOVA manual vaguely says it can be done ("...the VGA port can also have another monitor attached to it."). But when I plug the TTM195 into the TT's monitor port, the NOVA's monitor (a MultiSync) goes blank (no video, although it appears to be getting a proper signal, based on the monitor's status lights).

Does the NOVA manual's statement not hold true because the TTM195 isn't a VGA monitor, or do I need some form of video switchbox? Expecting to run two different resolutions at the same time seems implausible, so I'll assume a switchbox is needed so that the TT doesn't detect a second monitor (especially one generating an ECL signal).

I've had the TTM195 in storage ever since getting the NOVA card, so this is the first time I've ever attempted to run both monitors.

It would seem to make sense to me to also include an option in the
DIALER to activate STiNG itself. That would eliminate the need to go to
the STiNG Internals CPX (8 mouse clicks) just to activate it.

1830. Monthly DarkForce Winner!

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <6hsmce$53b$1@news.campus.mci.net>
Source record: 102365

Okay, we are running a bit behind this month but we do have a
winner. Matthew R. Norcross is our Atari Computing sub. winner.
He will receive a 6 month/3 volume subscription to Atari Comp.,
simply because he called the DarkForce! BBS one time last month.
You too could be a winner if you qualify. Its so easy, you just
have to call at least once a month. (oh yeah, you must be an
Atari owner!) ;-)

PS Didn't Mat and some
others do the "Bird
of Prey" CD-ROM? ;-)

On Wed, 15 Apr 1998 22:10:08 -0500 Mike Saeger <wanda@xnet.com> wrote:

>I purchased a blowup FX board and I am supposed to glue a heat sink onto
>my 68030 chip. Does anyone know what glue I can use that will conduct
>heat?

Here's a message I saved from comp.sys.ibm.pc.hardware.misc some time
ago that might be of help:

=======================

on my web site, you'll find many suggestions for cooling
these cards, including instructions on how to fix a heatsink.

http://www.isjm.com/tst/heatsink/ (under the graphics card
cooling section).

I would recommend the "heat-conductive cement" from
Computer Nerd.

regards,
Tillmann

=======================

The message was referring to a 3Dfx based graphics card, but the
instructions for affixing a heatsink should apply to any chip.

1834. [PUB] SOFTJEE

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: Jaccard Emmanuel <softjee@wanadoo.fr>
Message-ID: <3541F8B0.288C@wanadoo.fr>
Source record: 102369

Hello everybody,

Some informations about SOFTJEE's product for Atari Falcon.

** EXPAND

Expand is a Midi Sampler Software. You can load audio sound, make instruments multi-sample and play them with a Midi keyboard or a sequencer. You can set too the ADSR for each sound, have graphic panoramic setting,...Expand understand the most of Midi messages like note-on, note-off, program change, main volume, pitch, fine,...

You can too put some digital effects on each channel like Reverb, Echo, Chorus,...

Last revision is 1.03 with the following function added :
Play AIF in D2D, load WAV, Selecting of External Clock, Frequencies of replay, set repeatt start/end of each sample, set polyphonic voice for each Midi channel (select automatic for dynamic polyphonic voice or set the number of voice for each channel).

** MIDPLAY

Midplay is a Midifile player which play MID with audio sounds (so you can hear Midifile only with Midplay and your Falcon). Midplay can play too KAR file and displays the text of these files. Midplay use a GM kit audio to play midifiles. You can mute each channel, have informations on it,...

Last revision is 1.07

** Pretty

Pretty is a Midifile Player BUT with MIDI OUT.(this is the difference with Midplay). You can plays play list of Midile/Dir of Midiles. Pretty have too severals options like "Record Module" which allow you to record in audio the Midifile you're playing and "Grid edit Module" to display/change the Midifile.

Last revision is 1.01

** DIGITAL HOME STUDIO (D.H.S.)

D.H.S. is a very big soft allowing you to sample audio sound, sequence audio sound in D2D or memory/ sequence Midi informations. D.H.S can load 256 samples and you can play them with any note you want. You can put them on the sequencer or edit them in the sampler. You can apply digital effects in real times or in the sampler. You can use in the sequencer

Midi information/audio sound/Direct To disk sound in the same time. You have too some graphic function to set main volume of each track, effect level,...

D.H.S. manage 64 voices/ 32 tracks and play at 50 Khz 16 bits.

Last revision is 1.07.

You can see more details on the Web :

http://perso.wanadoo.fr/softjee/

or mail to :

softjee@wanadoo.fr

1835. Re: ezBack and ZIPdrive

On Wed, 15 Apr 1998 11:50:04 +0200 (MET DST) pricard@club-internet.fr (Pascal Ricard) wrote:

>I've been told that Zip drives are basically SCSI drives, and that the >parallel interface is an add-on in the case. Maybe it is possible to wire >out the SCSI interface ?

When I once had a parallel port Zip, I opened it and examined the internals. I found no separate SCSI-to-parallel adapter.

I believe I still have the scan available that I made of the PCB.

One of these days I need to open up my SCSI Zip and compare.

1836. GAL PAL

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <3541b9fa5fa851@game-master.com>
Source record: 102371

I have a half-baked desire to modify the serial port in my MegaSTE
because I cannot DL binaries via a PPP connection (ie STING), although
transfers via Zmodem are error free.

I've been told that I have to modify the GAL / PAL whatever according
to the docs in FSER096B.LZH, which are all in german, and, although I
took a german class in university, are incomprehensible to me.

I found an english version of the package (FSER096E.LZH) but it
doesn't include the document that I need. I tried to translate it at
the ALTAVISTA translating service, but CAB crashed on me. I tried to
translate it with RUFTRADE and I will share a little bit of that with
you:

And here at last the langerwartete new SCC-GAL!
This GAL removes\ed with (to) me the hardware failure of Seriell2 and senkt the mittl.
Error rate by the Send to circa. 1 Byte/600K. More could I hitherto not
reach, there this Restfehler probable(ly) nothing with the GAL,
but with the BlitterDMA/ACSI-DMA to do has. The could I though from
lack of time still not closer erforschen.

I could the GAL unfortunately still to no MSTE of the new Revision test
(Blittersockel empty, is in GSTMCU integrates\ed). Over corresponding(ly)
Erfahrungsberichte (Hallo Jï¿½rgen! Nox@jelal...) would I me please.

At the bottom follow as well as the GAL-Gleichungen as\than too the accompanying
JEDEC-File.
The brennt to it in a GAL 16V8-15 (on the best A-or B-type, faster damages
not, DIL-case) and replaces\ed with it a PAL16R4 (Checksum $5613) to the
position UA03 (unfortunately under the mains adapter, caution with the Lï¿½fter by the
Out of/building in!).
With the Glï¿½cklichen under (to) you is the Chip held,that other have to the
Beine abzwicken and single auslï¿½ten.

.....

Does _anyone_ have an english translation of MSTE_GAL.TXT?

Source record: 102372

on Sat 25-04-98 10:55 Neil Roughley wrote:

>Is it possible to run two monitors on a NOVA-equipped TT?

Well I think it's possible with SOME programs like Calamus ... have
you never looked at the upper strip menu in Calamus ... where the two
little screens are ... But, of course you need some extra module to
drive this kind of application ....
A few years ago when my club decided to publish an audio CD, I made
the cover and went to a Brussels shop to print the offset films and
there they had two screens: one 21' SVGA and a TTM195 ... and they were
able under some Calamus configuration to use both screens but I never
went further ...

Best keep a backup of it. Here, Newsie likes to occassionally delete its
address book and server list. One time it deleted itself, and its resource.
It's just as well that I have a mirror of each partition, or I'd have had
to rebuild them both again.

BTW, if you do need to build a new server list, check Hallvards site:

http://www.geocities.com/SiliconValley/Bay/8745/

as it is a goldmine as far as FTP and other useful sites go.

As that is the filesize of the module in the v1.12 archive, even though the
date's a few days later, it would seem that is the one that caused the
slowdown.

Hi John, Emmanuel, Tony,

I simply agree. As far as I'm concerned, I'd say: make it MagiC-compatible.
Just for one reason: any, just ANY program these days that's not MagiC
compatible will NOT stay on my system. Simple as that. I only make exceptions
for programs that are old and there's no substitute for in modern versions.

I like the idea of Tony, but if it won't run here under MagiC its destiny will
be the Trashcan...
To be more demanding: it should run on graphic cards as well (especially my one
:-), a Matrix). I kicked out M_Player because it won't run on a Matrix. And I
can name more....

Shouldn't worry you too much, I got TVT102 running here as a Telnet client.
Boris told me he programmed it without having MagiC in mind and it's just
running fine under MagiC. But I simply say: any new program that won't run
under "nowadays circumstances" won't get my attention.

And that's as far as my 2 cents go....

If you use other comms programs regularly I guess you're stuck with
all that clicking. If STinG is your only or main comms program (ie
that uses the serial port), you can just activate it and save the
settings in the CPX. You never have to fiddle with it again unless you
want to use another program which uses the port, in which case you can
temporarily disable it in the CPX.

True, but there aren't many Atari users who'll be using their machines
for HTML authoring who aren't also using them for HTML viewing (for a
kick-off it helps being able to check your results...). Most of those
who use their machines for HTML authoring will also be using them for
net access (even if only occasionally), I would bet a *small* amount
of money. It's more likely that they'll also have an upgraded machine
of some sort, ie more RAM and a hard drive, plus an OS upgrade of some
description.

>eeerm well you are right, I have never made a secret of not liking GEM

Well, I have no green on my mono monitor :-) And you can put nice
pictures on your desktop, change the colours (asuming a colour
display) etc. GEM's as boring as you want it to be. I'll admit med rez
is pretty hideous but that's more to do with silly stretched icons and
text than anything else.

>>of fiddling) for much of its target user-base. Especially considering
>
>I dissagree... much of its target user base wont be hades or milan
>owners.... the only people who miss out are Magic users...

And Geneva, and MultiTOS/N.AES... according to AC no.3's reader survey
that's 25% of the AC readership altogether. Irrespective of the
hardware issue, or display rez issue for that matter. I still reckon
that group of 25% is more likely to be involved with web projects than
the other 75% <cue avalanche of messages from people using
single-floppy 1040STFMs with a TV in med rez to maintain monstrously
huge web sites...>.

>I do believe all ST's, megas, falcons and tt owners are the majority,
>not hades, milan and magic users..
>If it was a simple case of choice (shall i shant i) then of course I
>would include all..but its not that simple,

Well, you're the one doing the work and making it available is
generous in itself (much appreciated). Told you you'd have no trouble
ignoring my tuppence-worth (even in a public forum) :-)

Isn't that what the XBIOS call, Floprate() is for?
Or am I missing something obvious here?

1848. Re: Stupid Newbie Question (hard drive problem)

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <35421020.6375051@news.tmisnet.com>
Source record: 102383

Well, here's a little bit of help, anyway:

From the menu bar on the desktop, look for an
"install icon" (early TOS) or "install devices"
(later TOS) selection.

If a dialog box appears, fill in the drive letter
("C" for the first partition of the hard drive.
Don't use "c" -- that's the contents of the
cartridge port!) and give the drive a name that
will appear on the desktop.

Click on OK to put the icon on your desktop. Double-
click the C icon, and you should have access to your
hard drive.

Remember to save the desktop so you don't have to
install the icon again the next time you turn on
your computer.

Hopefully, there will be a pre-existing SYS file in
the C partition that gets you up & running.

To the best of my knowledge, there's no-sucha-thing
as a floppy boot disk, since TOS/GEM is loaded from
ROM. Other than that, I'm afraid I can't help you
with the floppy disk symptoms. Hopefully, someone
else will.

If there are changes in the GEM/TOS operating
system you'd like to see ... or some hardware
refinement, head to the Wizztronics web page
http://www.wizztronics.com and look for their
request for input.

Don't take too long, something's about to happen.

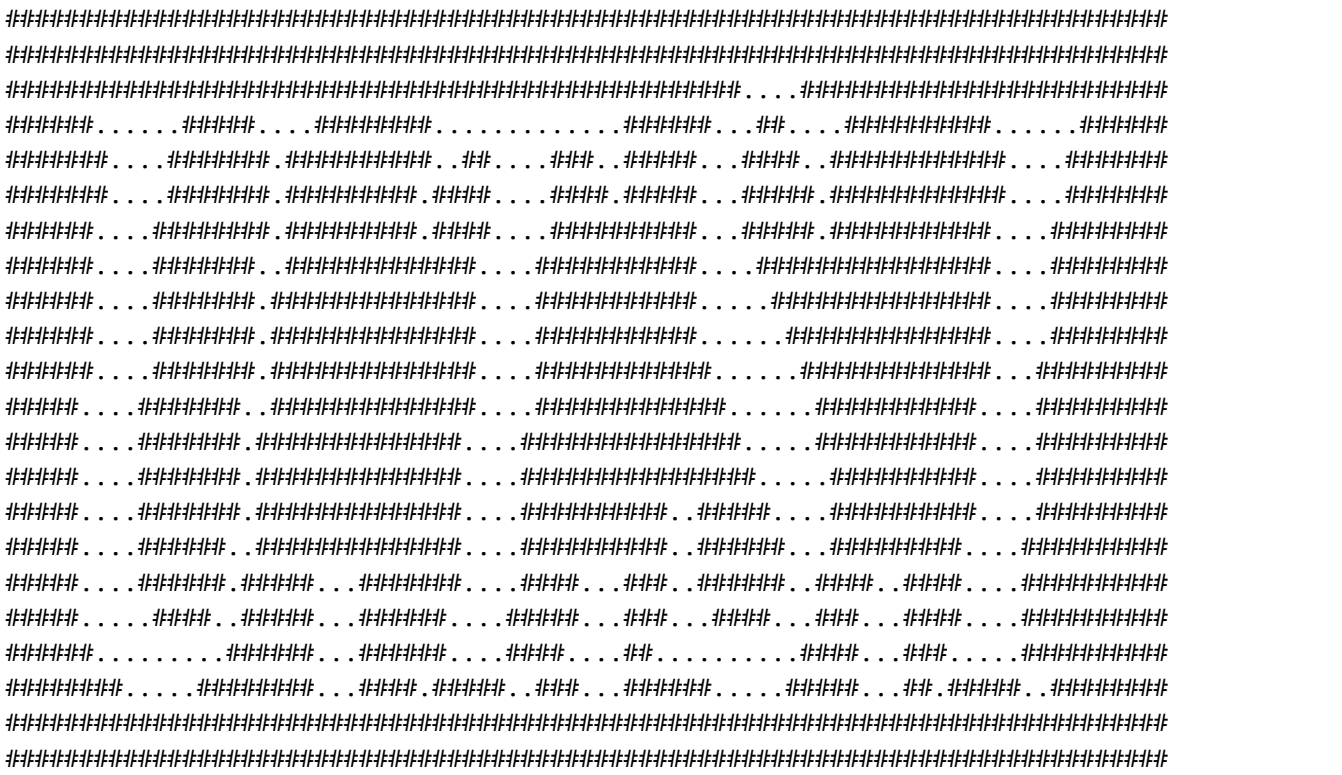
1851. [U.T.S.I] april 25 update

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: dipching@ping.be
Message-ID: <354238002fa9cd1@ping.be>
Source record: 102386
Cross-posted to: comp.sys.atari.st,maus.sys.atari.software



Of course, as ever, UTSI don't stop to grow ... hope it will never
cease :)
At this time, you will be at last able to download again the PARX.SYS
taken from Frï¿½dï¿½ric Bayle download web page ... the link is in the
"GRAPHIC" UTSI section of he UTSI under the name "M & E Systï¿½me" ...
You must absolutely discover some japanese atari programs from Hiroshi Dobashi !
You'll find a japanese text viewer but also an editor ! All to
discover from the "TEXT" UTSI under the following names: KAND and JAXT
... the same author has also made some midi utility and some desktop
utilities ... the only drawback is that his programs will only run
under ST high in black and white.

The last version of Aniplayer soon should appear because I have now
received the last besta version 2.1 from Didier Mequignon ...

If you are not aware of Arnaud Bercegeay html utilities, then it's
time to discover them in the "UTILITY WWW" UTSI section, like his
brand new "IH !" which allow to define the pictures inside html
documents !!!!!!!!!!
Let's hope that Arnaud will put all of his programs together to soon
obtain a true html editor in real time .... more, some of his

programs run with the ability to use the Parx System ...

Last time UTSI was about 731 indexed programs, now we have 785.

Thank you very much to everyone who keep me aware of all kinds of
url available programs, like Pascal Ricard, Frï¿½dï¿½ric Dinh and any
other ...

Don't forget to send me your comments but ABOVE ALL send me your links
to new and older programs which are not yet inside the UTSI ... it's
always a pleasure to add new links !

Jo Vandeweghe

There is definitely something wrong with the N.AES CD I've.
Whatever I try I can't read the CD anymore so I went today to my
brother who has a Performa 630 to see what happens on his machine.
It took quite a while before the Performa recognised the CD. To my
brothers astonishment the Mac displayed two CD icons on the desktop.
Each icon represented the same CD. Why? I don't know.

Thanks Guy, but the program I was looking for is a bit different: it
can extract files from corrupted zip archives.
A kind user has already sent it to me.

TOS #35 is an error meaning that that file is corrupted. You've possibly got
to re-install from master disks or from a backup.

Cheers!

b> transfer Files.
b> any help really appreciated

If it is the SCSI version then yes (using a host adapter such as The Link 2
or the latest Link 97) it works great - I have one of these.

If its a parallel, then the answer is more complicated, as generally you
can't attach the parallel Zip to the ST's parallel port (its not fully 2-way
- ie its ok for printers but not for drives). However there is an interface
available in Germany (sorry don't know where to get it) that attaches to the
ST's cartridge port which then connects to the Zip which does work.

Cheers!

>took a german class in university, are incomprehensible to me.

GAL / PAL circuits are progammable logic (gate array's). Most of the
german DIY stuff uses them. Unfortunately you first need the parts which
are not that easy to find (IMHO) since they are a bit dated already,
and you also need a burner. Some EPROM burners will do the trick.

It's a rather irritating habit to use GAL's since some upgrades like
the commercial overscan utility can be built from 3 ordinary TTL circuits
instead of two PAL circuit. (OK. It saves som space.)

Some of the authors gave their address so that you could order the
pre-programmed ciruits from them. Did you find anything like that?

Thomas

I suspected it might be freeware from your past record. My point is
that it sounds useful enough to be worth paying for. If you're
offering to do it for nowt then who am I to complain? However, as you
seem to be still in the early stages I felt it worth joining in with
the others who are pointing out the major flaw in the project (from my
perspective at least).

>>it's a GEM legal program that runs under MagiC and other modern

>everything from a half meg floppy fm right up to those machines... not
>much I can tell you.......

You may have the majority of all users, but have you got the majority
of those people who are using Ataris for web projects? Just my hunch
but I suspect that for that group multitasking OSs are more prevalent
and they are the people who will be looking into TOS clones and
MagiCMac/MagiCPC. At least with clean GEM programs you'll be covering
everything from a 1040 up (you might be cutting off 520 owners, but
can you even run CAB on a 520 anyway?).

>>If you really can't stand the idea of using GEM, you'd be better
>

>eerm Its not by choice.. what makes you think i don't like the idea?

My vague recollection of previous posts of yours. Apologies if I've
got the wrong end of the stick.

>>making it a text-based TOS or TTP program.
>
>Your kiddin yes?

Actually not totally. As the jobs you listed are basically batch-type
jobs anyway (you actually call it a batch toolbox IIRC) you could
probably do it quite nicely with a TTP and a bunch of command line
parameters. That should run on anything, just about (I'd have
thought). Some helpful soul would probably end up writing a nice GEM
shell for it, too :-))

>>Just my tuppence-worth...
>
>Unfortunatly the original post was looking for beta testers.. but all
>it has produced thus for is ...hmm well..... makes ya wonder if its
>all worth it eh ?:(

As I said, just my tuppence-worth, which is easily ignored!

Interesting that others have had similar thoughts, though. I actually
thought (from your subject line) you wanted suggestions/opinions as
well as beta testers. Apologies if that's not the case.

But let me be clear about my opinion: the program's functionality
sounds wonderful, it just seems a shame to cripple it with some quirky
interface that renders it unusable (either completely or without a lot
of fiddling) for much of its target user-base. Especially considering
the work you're about to put in to writing the thing. I *don't* want
you to not make the program. But it could be so much more usable with
a standard interface.

1858. Re: STacy, STBook, and more

Newsgroup: comp.sys.atari.st
Date: 1998-04-25 00:00:00 UTC
From: "Sheldon H. Winick" <s.winick@worldnet.att.net>
Message-ID: <6hrlnu$72p@bgtnsc02.worldnet.att.net>
Source record: 102441

David,

> Is the STBook actually the same as the STacy?

Not even close! The STacy was a bulky, heavy "luggable: portable system, essentially an almost full-size ST system with a folding backlit LCD screen. It was also probably the most troublesome and difficult to service product ever marketed by Atari.

The ST book was a very compact, extremely lightweight notebook sized portable, althought you may have trouble trying to find one with the battery necessary to make it truly portable. It was an almost excellent design, but the screen was NOT backlit, meaning it was not very practical for most musicians performing on stage.

> Does it run most ST software
> (I'm mainly interested in Cubase, Notator, Avalon, and some others)?

Yes -- no problem.

> What's the screen like to actually use?

As long as the screen has front lighting, it was very nice.

Major drawback of both the STacy and the STBook was that they were both ran at only 8MHz.
The STBook, by the way, had an EXTERNAL floppy disk drive; only the hard drive was internal. That was done to keep the weight down and extend the battery life to 10 hours -- although the battery, from what I understand, was even rarer than the STBook. ;-)

Anyone interested in buying the following mags from me?

ST Review Magazines
With Disks (without - 33)
5, 7, 7, 21, 26, 27, 28, 29, 30, 30, 31, 32, 34, 35

ST User
Ranging from Volume 1 issue 1, to the last but one issue October 94.
Around 72 mags in total, including all cover disks where applicable.

I am contemplating selling my full sets of ST Applications, ST Revieww
and ST Formats - dunno yet - but make me a good offer and they will
probably be yours. ;)

Collection from Essex, London or manchester - otherwise a hefty
postage charge.

Regards

Hi Jo and all the others,

neither am I, and the same goes for a Matrix card: got the SVGA hooked up to
the card, and an old VGA paperwhite (till this PTC1426 is fixed again) to the
TT-socket. No problemo, and usually it comes in quite handy when going thru'
the boot procedures to find out what's going on (or not).

Hi Ian,
